[55118] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1624 gene, herein designated VGAM is inhibition of expression of VGAM1624 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1624 correlate with, and may be deduced from, the identity of the target genes which VGAM1624 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[55119] B-cell CLL/lymphoma 2 (BCL2, Accession NM\_000633) is a

VGAM1624 host target gene. BCL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL2 BINDING SITE, designated SEQ ID:6261, to the nucleotide sequence of VGAM1624 RNA, herein designated VGAM RNA, also designated SEQ ID:4335.

[55120] A function of VGAM1624 is therefore inhibition of B-cell CLL/lymphoma 2 (BCL2, Accession NM\_000633). Accordingly, utilities of VGAM1624 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL2. Cyclic Nucleotide Gated Channel Alpha 3 (CNCA3, Accession NM\_001298) is another VGAM1624 host target gene. CNCA3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CNCA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNCA3 BINDING SITE, designated SEQ ID:6977, to the nucleotide sequence of VGAM1624 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4335.

[55121] Another function of VGAM1624 is therefore inhibition of Cyclic Nucleotide Gated Channel Alpha 3 (CNGA3, Accession NM\_001298). Accordingly, utilities of VGAM1624 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNGA3. Potassium Voltage-gated Channel, Shaker-related Subfamily, Beta Member 2 (KCNAB2, Accession NM\_003636) is another VGAM1624 host target gene. KCNAB2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KCNAB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNAB2 BINDING SITE, designated SEQ ID:9710, to the nucleotide sequence of VGAM1624 RNA, herein designated VGAM RNA, also designated SEQ ID:4335.

[55122] Another function of VGAM1624 is therefore inhibition of Potassium Voltage-gated Channel, Shaker-related Subfamily, Beta Member 2 (KCNAB2, Accession NM\_003636), a gene which is the beta subunit of shaker voltage-gated potassium channels. Accordingly, utilities of VGAM1624 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with KCNAB2. The function of KCNAB2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM659. Steroidogenic Acute Regulatory Protein (STAR, Accession NM\_000349) is another VGAM1624 host target gene. STAR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STAR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STAR BINDING SITE, designated SEQ ID:5903, to the nucleotide sequence of VGAM1624 RNA, herein designated VGAM RNA, also designated SEQ ID:4335.

[55123] Another function of VGAM1624 is therefore inhibition of Steroidogenic Acute Regulatory Protein (STAR, Accession NM\_000349). Accordingly, utilities of VGAM1624 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STAR. DnaJ (Hsp40) Homolog, Subfamily B, Member 5 (DNAJB5, Accession NM\_012266) is another VGAM1624 host target gene. DNAJB5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

DNAJB5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNAJB5 BINDING SITE, designated SEQ ID:14586, to the nucleotide sequence of VGAM1624 RNA, herein designated VGAM RNA, also designated SEQ ID:4335.

[55124] Another function of VGAM1624 is therefore inhibition of DnaJ (Hsp40) Homolog, Subfamily B, Member 5 (DNAJB5, Accession NM\_012266). Accordingly, utilities of VGAM1624 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNAJB5. Mitogen-activated Protein Kinase Kinase Kinase 2 (MAP3K2, Accession NM\_006609) is another VGAM1624 host target gene. MAP3K2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAP3K2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP3K2 BINDING SITE, designated SEQ ID:13386, to the nucleotide sequence of VGAM1624 RNA, herein designated VGAM RNA, also designated SEQ ID:4335.

[55125] Another function of VGAM1624 is therefore inhibition of Mitogen-activated Protein Kinase Kinase 2 (MAP3K2, Accession NM\_006609). Accordingly, utilities of VGAM1624 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP3K2. LOC148809 (Accession XM\_086325) is another VGAM1624 host target gene. LOC148809 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148809, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148809 BINDING SITE, designated SEQ ID:38596, to the nucleotide sequence of VGAM1624 RNA, herein designated VGAM RNA, also designated SEQ ID:4335.

[55126] Another function of VGAM1624 is therefore inhibition of LOC148809 (Accession XM\_086325). Accordingly, utilities of VGAM1624 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148809. LOC149372 (Accession XM\_086509) is another VGAM1624 host target gene. LOC149372 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149372, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149372 BINDING SITE, designated SEQ ID:38726, to the nucleotide sequence of VGAM1624 RNA, herein designated VGAM RNA, also designated SEQ ID:4335.

[55127] Another function of VGAM1624 is therefore inhibition of LOC149372 (Accession XM\_086509). Accordingly, utilities of VGAM1624 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149372. LOC158428 (Accession XM\_047249) is another VGAM1624 host target gene. LOC158428 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158428, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158428 BINDING SITE, designated SEQ ID:34920, to the nucleotide sequence of VGAM1624 RNA, herein designated VGAM RNA, also designated SEQ ID:4335.

[55128] Another function of VGAM1624 is therefore inhibition of LOC158428 (Accession XM\_047249). Accordingly, utilities of VGAM1624 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC158428. LOC169026 (Accession XM\_095471) is another VGAM1624 host target gene. LOC169026 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC169026, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC169026 BINDING SITE, designated SEQ ID:40267, to the nucleotide sequence of VGAM1624 RNA, herein designated VGAM RNA, also designated SEQ ID:4335.

[55129] Another function of VGAM1624 is therefore inhibition of LOC169026 (Accession XM\_095471). Accordingly, utilities of VGAM1624 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC169026. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1625 (VGAM1625) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[55130] VGAM1625 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1625 was detected is described hereinabove with reference to Figs. 1–8.

[55131] VGAM1625 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Herpesvirus 4. VGAM1625 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[55132] VGAM1625 gene encodes a VGAM1625 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1625 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1625 precursor RNA is designated SEQ ID:1611, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1611 is located at position 86511 relative to the genome of Bovine Herpesvirus 4.

[55133] VGAM1625 precursor RNA folds onto itself, forming VGAM1625 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[55134] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1625 folded precursor RNA into VGAM1625 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1625 RNA is designated SEQ ID:4336, and is provided hereinbelow with reference to the sequence listing part.

[55135] VGAM1625 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1625 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1625 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[55136] VGAM1625 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1625 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1625 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1625 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1625 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[55137] The complementary binding of VGAM1625 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1625 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1625 host target RNA into VGAM1625 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[55138] It is appreciated that VGAM1625 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1625 host target genes. The mRNA of each one of this plurality of VGAM1625 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1625 RNA, herein designated VGAM RNA, and which when bound by VGAM1625 RNA causes inhibition of translation of respective one or more VGAM1625 host target proteins.

[55139] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1625 gene, herein designated VGAM GENE, on one or more VGAM1625 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[55140] It is yet further appreciated that a function of VGAM1625 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1625 include diagnosis, prevention and treatment of viral infection by Bovine Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1625 correlate with, and may be deduced from, the identity of the host target genes which VGAM1625 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[55141] Nucleotide sequences of the VGAM1625 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM1625 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1625 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1625 are further described hereinbelow with reference to Table 1.

[55142] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1625 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1625 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[55143] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1625 gene, herein designated VGAM is inhibition of expression of VGAM1625 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1625 correlate with, and may be deduced from, the identity of the target genes which VGAM1625 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[55144] Synaptotagmin XIII (SYT13, Accession XM\_167880) is a VGAM1625 host target gene. SYT13 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region

of mRNA encoded by SYT13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYT13 BINDING SITE, designated SEQ ID:44885, to the nucleotide sequence of VGAM1625 RNA, herein designated VGAM RNA, also designated SEQ ID:4336.

[55145] A function of VGAM1625 is therefore inhibition of Synaptotagmin XIII (SYT13, Accession XM\_167880). Accordingly, utilities of VGAM1625 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYT13. LOC148545 (Accession XM\_086226) is another VGAM1625 host target gene. LOC148545 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148545, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148545 BINDING SITE, designated SEQ ID:38552, to the nucleotide sequence of VGAM1625 RNA, herein designated VGAM RNA, also designated SEQ ID:4336.

[55146] Another function of VGAM1625 is therefore inhibition of LOC148545 (Accession XM\_086226). Accordingly, utilities

of VGAM1625 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148545. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1626 (VGAM1626) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[55147] VGAM1626 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1626 was detected is described hereinabove with reference to Figs. 1–8.

[55148] VGAM1626 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Herpesvirus 4. VGAM1626 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[55149] VGAM1626 gene encodes a VGAM1626 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1626 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu–

cleotide sequence of VGAM1626 precursor RNA is designated SEQ ID:1612, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1612 is located at position 80653 relative to the genome of Bovine Herpesvirus 4.

- [55150] VGAM1626 precursor RNA folds onto itself, forming VGAM1626 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [55151] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1626 folded precursor RNA into VGAM1626 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1626 RNA is designated SEQ ID:4337, and

is provided hereinbelow with reference to the sequence listing part.

[55152] VGAM1626 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1626 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1626 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[55153] VGAM1626 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1626 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1626 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM1626 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1626 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[55154] The complementary binding of VGAM1626 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1626 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1626 host target RNA into VGAM1626 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[55155] It is appreciated that VGAM1626 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1626 host target genes. The mRNA of each one of this plurality of VGAM1626 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com–

plementary to VGAM1626 RNA, herein designated VGAM RNA, and which when bound by VGAM1626 RNA causes inhibition of translation of respective one or more VGAM1626 host target proteins.

[55156] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1626 gene, herein designated VGAM GENE, on one or more VGAM1626 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[55157] It is yet further appreciated that a function of VGAM1626 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1626 include diagnosis, prevention and treatment of viral infection by Bovine Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1626 correlate with, and may be deduced from, the identity of the host target genes which VGAM1626 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[55158] Nucleotide sequences of the VGAM1626 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1626 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1626 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1626 are further described hereinbelow with reference to Table 1.

[55159] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1626 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1626 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[55160] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM1626 gene, herein designated VGAM is inhibition of expression of VGAM1626 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1626 correlate with, and may be deduced from, the identity of the target genes which VGAM1626 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[55161] Cyclin-dependent Kinase (CDC2-like) 10 (CDK10, Accession NM\_052988) is a VGAM1626 host target gene. CDK10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDK10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDK10 BINDING SITE, designated SEQ ID:27554, to the nucleotide sequence of VGAM1626 RNA, herein designated VGAM RNA, also designated SEQ ID:4337.

[55162] A function of VGAM1626 is therefore inhibition of Cyclin-dependent Kinase (CDC2-like) 10 (CDK10, Accession NM\_052988), a gene which plays a pivotal role in the regulation of the eukaryotic cell cycle. Accordingly, utilities of VGAM1626 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with CDK10. The function of CDK10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM193. Endoglin (Osler–Rendu–Weber syndrome 1) (ENG, Accession NM\_000118) is another VGAM1626 host target gene. ENG BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ENG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ENG BINDING SITE, designated SEQ ID:5594, to the nucleotide sequence of VGAM1626 RNA, herein designated VGAM RNA, also designated SEQ ID:4337.

[55163] Another function of VGAM1626 is therefore inhibition of Endoglin (Osler–Rendu–Weber syndrome 1) (ENG, Accession NM\_000118). Accordingly, utilities of VGAM1626 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ENG. FLJ21438 (Accession XM\_029084) is another VGAM1626 host target gene. FLJ21438 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ21438, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21438 BINDING SITE, designated SEQ ID:30845, to the nucleotide sequence of VGAM1626 RNA, herein designated VGAM RNA, also designated SEQ ID:4337.

[55164] Another function of VGAM1626 is therefore inhibition of FLJ21438 (Accession XM\_029084). Accordingly, utilities of VGAM1626 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21438. KIAA1610 (Accession XM\_040622) is another VGAM1626 host target gene. KIAA1610 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1610, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1610 BINDING SITE, designated SEQ ID:33339, to the nucleotide sequence of VGAM1626 RNA, herein designated VGAM RNA, also designated SEQ ID:4337.

[55165] Another function of VGAM1626 is therefore inhibition of KIAA1610 (Accession XM\_040622). Accordingly, utilities of VGAM1626 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1610. LOC221477 (Accession XM\_166397) is another VGAM1626 host target gene. LOC221477 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221477, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221477 BINDING SITE, designated SEQ ID:44253, to the nucleotide sequence of VGAM1626 RNA, herein designated VGAM RNA, also designated SEQ ID:4337.

[55166] Another function of VGAM1626 is therefore inhibition of LOC221477 (Accession XM\_166397). Accordingly, utilities of VGAM1626 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221477. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1627 (VGAM1627) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[55167] VGAM1627 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1627 was detected is described hereinabove with reference to Figs. 1–8.

[55168] VGAM1627 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Herpesvirus 4. VGAM1627 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[55169] VGAM1627 gene encodes a VGAM1627 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1627 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1627 precursor RNA is designated SEQ ID:1613, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1613 is located at position 80799 relative to the genome of Bovine Herpesvirus 4.

[55170] VGAM1627 precursor RNA folds onto itself, forming VGAM1627 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[55171] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1627 folded precursor RNA into VGAM1627 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1627 RNA is designated SEQ ID:4338, and is provided hereinbelow with reference to the sequence listing part.

[55172] VGAM1627 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1627 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1627 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[55173] VGAM1627 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1627 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1627 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1627 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1627 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[55174] The complementary binding of VGAM1627 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1627 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1627 host target RNA into VGAM1627 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[55175] It is appreciated that VGAM1627 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1627 host target genes. The mRNA of each one of this plurality of VGAM1627 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1627 RNA, herein designated VGAM RNA, and which when bound by VGAM1627 RNA causes inhibition of translation of respective one or more VGAM1627 host target proteins.

[55176] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1627 gene, herein designated VGAM GENE, on one or more VGAM1627 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[55177] It is yet further appreciated that a function of VGAM1627 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1627 include diagnosis, prevention and treatment of viral infection by Bovine Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1627 correlate with, and may be deduced from, the identity of the host target genes which VGAM1627 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[55178] Nucleotide sequences of the VGAM1627 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM1627 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1627 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1627 are further described hereinbelow with reference to Table 1.

[55179] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1627 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1627 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[55180] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1627 gene, herein designated VGAM is inhibition of expression of VGAM1627 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1627 correlate with, and may be deduced from, the identity of the target genes which VGAM1627 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[55181] LNK (Accession NM\_005475) is a VGAM1627 host target gene. LNK BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

LNK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LNK BINDING SITE, designated SEQ ID:11970, to the nucleotide sequence of VGAM1627 RNA, herein designated VGAM RNA, also designated SEQ ID:4338.

[55182] A function of VGAM1627 is therefore inhibition of LNK (Accession NM\_005475), a gene which links T-cell receptor activation signal to phospholipase c-gamma-1, grb-2 and phosphatidylinositol 3-kinase (by similarity). Accordingly, utilities of VGAM1627 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LNK. The function of LNK and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM115. Myosin IIIB (MYO3B, Accession NM\_138995) is another VGAM1627 host target gene. MYO3B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MYO3B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYO3B BINDING SITE, designated SEQ

ID:29094, to the nucleotide sequence of VGAM1627 RNA, herein designated VGAM RNA, also designated SEQ ID:4338.

[55183] Another function of VGAM1627 is therefore inhibition of Myosin IIIB (MYO3B, Accession NM\_138995). Accordingly, utilities of VGAM1627 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYO3B. LOC219920 (Accession XM\_167787) is another VGAM1627 host target gene. LOC219920 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC219920, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219920 BINDING SITE, designated SEQ ID:44802, to the nucleotide sequence of VGAM1627 RNA, herein designated VGAM RNA, also designated SEQ ID:4338.

[55184] Another function of VGAM1627 is therefore inhibition of LOC219920 (Accession XM\_167787). Accordingly, utilities of VGAM1627 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219920. LOC220279 (Accession XM\_169083) is another VGAM1627 host target gene. LOC220279 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220279, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220279 BINDING SITE, designated SEQ ID:45288, to the nucleotide sequence of VGAM1627 RNA, herein designated VGAM RNA, also designated SEQ ID:4338.

[55185] Another function of VGAM1627 is therefore inhibition of LOC220279 (Accession XM\_169083). Accordingly, utilities of VGAM1627 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220279. LOC255826 (Accession XM\_173938) is another VGAM1627 host target gene. LOC255826 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255826, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255826 BINDING SITE, designated SEQ ID:46569, to the nucleotide sequence of VGAM1627 RNA, herein designated VGAM RNA, also designated SEQ ID:4338.

[55186] Another function of VGAM1627 is therefore inhibition of

LOC255826 (Accession XM\_173938). Accordingly, utilities of VGAM1627 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255826. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1628 (VGAM1628) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[55187] VGAM1628 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1628 was detected is described hereinabove with reference to Figs. 1-8.

[55188] VGAM1628 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Herpesvirus 4. VGAM1628 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[55189] VGAM1628 gene encodes a VGAM1628 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1628 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1628 precursor RNA is designated SEQ ID:1614, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1614 is located at position 83406 relative to the genome of Bovine Herpesvirus 4.

- [55190] VGAM1628 precursor RNA folds onto itself, forming VGAM1628 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [55191] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1628 folded precursor RNA into VGAM1628 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide se-

quence of VGAM1628 RNA is designated SEQ ID:4339, and is provided hereinbelow with reference to the sequence listing part.

[55192] VGAM1628 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1628 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1628 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[55193] VGAM1628 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1628 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1628 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM1628 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1628 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[55194] The complementary binding of VGAM1628 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1628 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1628 host target RNA into VGAM1628 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[55195] It is appreciated that VGAM1628 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1628 host target genes. The mRNA of each one of this plurality of VGAM1628 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1628 RNA, herein designated VGAM RNA, and which when bound by VGAM1628 RNA causes inhibition of translation of respective one or more VGAM1628 host target proteins.

[55196] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1628 gene, herein designated VGAM GENE, on one or more VGAM1628 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[55197] It is yet further appreciated that a function of VGAM1628

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1628 include diagnosis, prevention and treatment of viral infection by Bovine Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1628 correlate with, and may be deduced from, the identity of the host target genes which VGAM1628 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[55198] Nucleotide sequences of the VGAM1628 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1628 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1628 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1628 are further described hereinbelow with reference to Table 1.

[55199] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1628 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1628 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[55200] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1628 gene, herein designated VGAM is inhibition of expression of VGAM1628 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1628 correlate with, and may be deduced from, the identity of the target genes which VGAM1628 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[55201] Down-regulator of Transcription 1, TBP-binding (negative cofactor 2) (DR1, Accession XM\_002015) is a VGAM1628 host target gene. DR1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DR1 BINDING SITE, designated SEQ ID:29858, to the nucleotide sequence of VGAM1628 RNA, herein designated VGAM RNA, also designated SEQ ID:4339.

[55202] A function of VGAM1628 is therefore inhibition of Down-regulator of Transcription 1, TBP-binding (negative cofactor 2) (DR1, Accession XM\_002015), a gene which influences functional repression of both activated and basal

transcription of class ii genes. Accordingly, utilities of VGAM1628 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DR1. The function of DR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM711. Fatty Acid Binding Protein 2, Intestinal (FABP2, Accession NM\_000134) is another VGAM1628 host target gene. FABP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FABP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FABP2 BINDING SITE, designated SEQ ID:5625, to the nucleotide sequence of VGAM1628 RNA, herein designated VGAM RNA, also designated SEQ ID:4339.

[55203] Another function of VGAM1628 is therefore inhibition of Fatty Acid Binding Protein 2, Intestinal (FABP2, Accession NM\_000134), a gene which may have a role in dietary fat uptake or processing. Accordingly, utilities of VGAM1628 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FABP2. The func-

tion of FABP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM951. Lactate Dehydrogenase B (LDHB, Accession NM\_002300) is another VGAM1628 host target gene. LDHB BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LDHB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LDHB BINDING SITE, designated SEQ ID:8088, to the nucleotide sequence of VGAM1628 RNA, herein designated VGAM RNA, also designated SEQ ID:4339.

[55204] Another function of VGAM1628 is therefore inhibition of Lactate Dehydrogenase B (LDHB, Accession NM\_002300), a gene which causes dehydrogenation of lactate. Accordingly, utilities of VGAM1628 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LDHB. The function of LDHB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM273. AUT-like 1, Cysteine Endopeptidase (*S. cerevisiae*) (AUTL1, Accession

NM\_032852) is another VGAM1628 host target gene.

AUTL1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by AUTL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AUTL1 BINDING SITE, designated SEQ ID:26647, to the nucleotide sequence of VGAM1628 RNA, herein designated VGAM RNA, also designated SEQ ID:4339.

[55205] Another function of VGAM1628 is therefore inhibition of AUT-like 1, Cysteine Endopeptidase (*S. cerevisiae*) (AUTL1, Accession NM\_032852). Accordingly, utilities of VGAM1628 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AUTL1. UDP-Gal:betaGlcNAc Beta 1,3-galactosyltransferase, Polypeptide 1 (B3GALT1, Accession NM\_020981) is another VGAM1628 host target gene. B3GALT1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by B3GALT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B3GALT1

BINDING SITE, designated SEQ ID:21971, to the nucleotide sequence of VGAM1628 RNA, herein designated VGAM RNA, also designated SEQ ID:4339.

[55206] Another function of VGAM1628 is therefore inhibition of UDP-Gal:betaGlcNAc Beta 1,3-galactosyltransferase, Polypeptide 1 (B3GALT1, Accession NM\_020981). Accordingly, utilities of VGAM1628 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B3GALT1. GNB4 (Accession NM\_021629) is another VGAM1628 host target gene. GNB4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GNB4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNB4 BINDING SITE, designated SEQ ID:22267, to the nucleotide sequence of VGAM1628 RNA, herein designated VGAM RNA, also designated SEQ ID:4339.

[55207] Another function of VGAM1628 is therefore inhibition of GNB4 (Accession NM\_021629). Accordingly, utilities of VGAM1628 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNB4. OBTP (Accession NM\_017601) is another VGAM1628 host

target gene. OBTP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by OBTP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OBTP BINDING SITE, designated SEQ ID:19081, to the nucleotide sequence of VGAM1628 RNA, herein designated VGAM RNA, also designated SEQ ID:4339.

[55208] Another function of VGAM1628 is therefore inhibition of OBTP (Accession NM\_017601). Accordingly, utilities of VGAM1628 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OBTP. LOC157663 (Accession XM\_088354) is another VGAM1628 host target gene. LOC157663 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC157663, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157663 BINDING SITE, designated SEQ ID:39637, to the nucleotide sequence of VGAM1628 RNA, herein designated VGAM RNA, also designated SEQ ID:4339.

[55209] Another function of VGAM1628 is therefore inhibition of LOC157663 (Accession XM\_088354). Accordingly, utilities of VGAM1628 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157663. LOC199926 (Accession XM\_117157) is another VGAM1628 host target gene. LOC199926 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199926, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199926 BINDING SITE, designated SEQ ID:43262, to the nucleotide sequence of VGAM1628 RNA, herein designated VGAM RNA, also designated SEQ ID:4339.

[55210] Another function of VGAM1628 is therefore inhibition of LOC199926 (Accession XM\_117157). Accordingly, utilities of VGAM1628 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199926. LOC202316 (Accession XM\_117380) is another VGAM1628 host target gene. LOC202316 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC202316, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202316 BINDING SITE, designated SEQ ID:43427, to the nucleotide sequence of VGAM1628 RNA, herein designated VGAM RNA, also designated SEQ ID:4339.

[55211] Another function of VGAM1628 is therefore inhibition of LOC202316 (Accession XM\_117380). Accordingly, utilities of VGAM1628 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202316. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1629 (VGAM1629) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[55212] VGAM1629 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1629 was detected is described hereinabove with reference to Figs. 1-8.

[55213] VGAM1629 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Herpesvirus 4. VGAM1629 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[55214] VGAM1629 gene encodes a VGAM1629 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1629 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1629 precursor RNA is designated SEQ ID:1615, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1615 is located at position 88808 relative to the genome of Bovine Herpesvirus 4.

[55215] VGAM1629 precursor RNA folds onto itself, forming VGAM1629 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[55216] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1629 folded precursor RNA into VGAM1629

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1629 RNA is designated SEQ ID:4340, and is provided hereinbelow with reference to the sequence listing part.

[55217] VGAM1629 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1629 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1629 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[55218] VGAM1629 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1629 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1629 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1629 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1629 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[55219] The complementary binding of VGAM1629 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1629 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1629 host target RNA into VGAM1629 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[55220] It is appreciated that VGAM1629 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1629 host target genes. The mRNA of each one of this plurality of VGAM1629 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1629 RNA, herein designated VGAM RNA, and which when bound by VGAM1629 RNA causes inhibition of translation of respective one or more VGAM1629 host target proteins.

[55221] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1629 gene, herein designated VGAM GENE, on one or more VGAM1629 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[55222] It is yet further appreciated that a function of VGAM1629 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1629 include diagnosis, prevention and treatment of viral infection by Bovine Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1629 correlate with, and may be deduced from, the identity of the host target genes which VGAM1629 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[55223] Nucleotide sequences of the VGAM1629 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1629 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1629 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1629 are further described hereinbelow with reference to Table 1.

[55224] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1629 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1629 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[55225] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1629 gene, herein designated VGAM is inhibition of expression of VGAM1629 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1629 correlate with, and may be deduced from, the identity of the target genes which VGAM1629 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[55226] DnaJ (Hsp40) Homolog, Subfamily B, Member 5 (DNAJB5, Accession NM\_012266) is a VGAM1629 host target gene. DNAJB5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DNAJB5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNAJB5 BINDING SITE, designated SEQ ID:14587, to the nucleotide sequence of VGAM1629 RNA,

herein designated VGAM RNA, also designated SEQ ID:4340.

[55227] A function of VGAM1629 is therefore inhibition of DnaJ (Hsp40) Homolog, Subfamily B, Member 5 (DNAJB5, Accession NM\_012266). Accordingly, utilities of VGAM1629 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNAJB5. KIAA1001 (Accession NM\_014960) is another VGAM1629 host target gene. KIAA1001 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1001, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1001 BINDING SITE, designated SEQ ID:17326, to the nucleotide sequence of VGAM1629 RNA, herein designated VGAM RNA, also designated SEQ ID:4340.

[55228] Another function of VGAM1629 is therefore inhibition of KIAA1001 (Accession NM\_014960). Accordingly, utilities of VGAM1629 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1001. Kinase Suppressor of Ras (KSR, Accession XM\_034172) is another VGAM1629 host target gene. KSR

BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KSR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KSR BINDING SITE, designated SEQ ID:32020, to the nucleotide sequence of VGAM1629 RNA, herein designated VGAM RNA, also designated SEQ ID:4340.

[55229] Another function of VGAM1629 is therefore inhibition of Kinase Suppressor of Ras (KSR, Accession XM\_034172). Accordingly, utilities of VGAM1629 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KSR. PRP8 Pre-mRNA Processing Factor 8 Homolog (yeast) (PRPF8, Accession XM\_028335) is another VGAM1629 host target gene. PRPF8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRPF8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRPF8 BINDING SITE, designated SEQ ID:30679, to the nucleotide sequence of VGAM1629 RNA, herein designated VGAM RNA, also designated SEQ ID:4340.

[55230] Another function of VGAM1629 is therefore inhibition of PRP8 Pre-mRNA Processing Factor 8 Homolog (yeast) (PRPF8, Accession XM\_028335). Accordingly, utilities of VGAM1629 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRPF8. SR-BP1 (Accession NM\_005866) is another VGAM1629 host target gene. SR-BP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SR-BP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SR-BP1 BINDING SITE, designated SEQ ID:12484, to the nucleotide sequence of VGAM1629 RNA, herein designated VGAM RNA, also designated SEQ ID:4340.

[55231] Another function of VGAM1629 is therefore inhibition of SR-BP1 (Accession NM\_005866). Accordingly, utilities of VGAM1629 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SR-BP1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1630 (VGAM1630) viral gene, which modulates expression

of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[55232] VGAM1630 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1630 was detected is described hereinabove with reference to Figs. 1–8.

[55233] VGAM1630 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Herpesvirus 4. VGAM1630 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[55234] VGAM1630 gene encodes a VGAM1630 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1630 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1630 precursor RNA is designated SEQ ID:1616, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1616 is located at position 84159 relative to the genome of Bovine Herpesvirus 4.

[55235] VGAM1630 precursor RNA folds onto itself, forming VGAM1630 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[55236] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1630 folded precursor RNA into VGAM1630 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 63%) nucleotide sequence of VGAM1630 RNA is designated SEQ ID:4341, and is provided hereinbelow with reference to the sequence listing part.

[55237] VGAM1630 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1630 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1630 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[55238] VGAM1630 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1630 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1630 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1630 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1630 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[55239] The complementary binding of VGAM1630 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1630 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1630 host target RNA into VGAM1630 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[55240] It is appreciated that VGAM1630 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1630 host target genes. The mRNA of each one of this plurality of VGAM1630 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1630 RNA, herein designated VGAM RNA, and which when bound by VGAM1630 RNA causes inhibition of translation of respective one or more VGAM1630 host target proteins.

[55241] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1630 gene, herein designated VGAM GENE, on one or more VGAM1630 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[55242] It is yet further appreciated that a function of VGAM1630 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1630 include diagnosis, prevention and treatment of viral infection by Bovine Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1630 correlate with, and may be deduced from, the identity of the host target genes which VGAM1630 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[55243] Nucleotide sequences of the VGAM1630 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1630 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1630 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1630 are further described hereinbelow with reference to Table 1.

[55244] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1630 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1630 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[55245] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1630 gene, herein designated VGAM is inhibition of expression of VGAM1630 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1630 correlate with, and may be deduced from, the identity of the target genes which VGAM1630 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[55246] Fatty Acid Binding Protein 2, Intestinal (FABP2, Accession NM\_000134) is a VGAM1630 host target gene. FABP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FABP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FABP2 BINDING SITE, designated SEQ ID:5626, to the nucleotide sequence of VGAM1630 RNA, herein designated VGAM RNA, also designated SEQ ID:4341.

[55247] A function of VGAM1630 is therefore inhibition of Fatty Acid Binding Protein 2, Intestinal (FABP2, Accession NM\_000134), a gene which may have a role in dietary fat uptake or processing. Accordingly, utilities of VGAM1630 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FABP2. The function of FABP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM951. Protein Kinase, AMP-activated, Alpha 2 Catalytic Subunit (PRKAA2, Accession NM\_006252) is another VGAM1630 host target gene. PRKAA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by PRKAA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRKAA2 BINDING SITE, designated SEQ ID:12929, to the nucleotide sequence of VGAM1630 RNA, herein designated VGAM RNA, also designated SEQ ID:4341.

[55248] Another function of VGAM1630 is therefore inhibition of Protein Kinase, AMP-activated, Alpha 2 Catalytic Subunit (PRKAA2, Accession NM\_006252), a gene which are responsible for the regulation of fatty acid synthesis by phosphorylation of acetyl-coa carboxylase. Accordingly, utilities of VGAM1630 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKAA2. The function of PRKAA2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1544. G-protein Coupled Receptor 88 (GPR88, Accession NM\_022049) is another VGAM1630 host target gene. GPR88 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPR88, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPR88 BINDING SITE, designated SEQ ID:22571, to the nucleotide sequence of VGAM1630 RNA, herein designated VGAM RNA, also designated SEQ ID:4341.

[55249] Another function of VGAM1630 is therefore inhibition of G-protein Coupled Receptor 88 (GPR88, Accession NM\_022049). Accordingly, utilities of VGAM1630 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR88. LOC148946 (Accession XM\_097557) is another VGAM1630 host target gene. LOC148946 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148946, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148946 BINDING SITE, designated SEQ ID:40937, to the nucleotide sequence of VGAM1630 RNA, herein designated VGAM RNA, also designated SEQ ID:4341.

[55250] Another function of VGAM1630 is therefore inhibition of LOC148946 (Accession XM\_097557). Accordingly, utilities of VGAM1630 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC148946. LOC90750 (Accession XM\_033868) is another VGAM1630 host target gene. LOC90750 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90750, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90750 BINDING SITE, designated SEQ ID:31966, to the nucleotide sequence of VGAM1630 RNA, herein designated VGAM RNA, also designated SEQ ID:4341.

[55251] Another function of VGAM1630 is therefore inhibition of LOC90750 (Accession XM\_033868). Accordingly, utilities of VGAM1630 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90750. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1631 (VGAM1631) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[55252] VGAM1631 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1631 was detected is described hereinabove with reference to Figs. 1–8.

[55253] VGAM1631 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Herpesvirus 4. VGAM1631 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[55254] VGAM1631 gene encodes a VGAM1631 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1631 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1631 precursor RNA is designated SEQ ID:1617, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1617 is located at position 90442 relative to the genome of Bovine Herpesvirus 4.

[55255] VGAM1631 precursor RNA folds onto itself, forming VGAM1631 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[55256] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1631 folded precursor RNA into VGAM1631 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1631 RNA is designated SEQ ID:4342, and is provided hereinbelow with reference to the sequence listing part.

[55257] VGAM1631 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1631 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1631 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[55258] VGAM1631 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1631 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1631 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1631 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1631 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[55259] The complementary binding of VGAM1631 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1631 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1631 host target RNA into VGAM1631 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[55260] It is appreciated that VGAM1631 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1631 host target genes. The mRNA of each one of this plurality of VGAM1631 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1631 RNA, herein designated VGAM RNA, and which when bound by VGAM1631 RNA causes inhibition of translation of respective one or more VGAM1631 host target proteins.

[55261] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1631 gene, herein designated VGAM GENE, on one or more VGAM1631 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[55262] It is yet further appreciated that a function of VGAM1631 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1631 include diagnosis, prevention and treatment of viral infection by Bovine Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1631 correlate with, and may be deduced from, the identity of the host target genes which VGAM1631 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[55263] Nucleotide sequences of the VGAM1631 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM1631 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1631 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1631 are further described hereinbelow with reference to Table 1.

[55264] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1631 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1631 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[55265] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1631 gene, herein designated VGAM is inhibition of expression of VGAM1631 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1631 correlate with, and may be deduced from, the identity of the target genes which VGAM1631 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[55266] Hepatocyte Growth Factor (hepapoietin A; scatter factor) (HGF, Accession XM\_168542) is a VGAM1631 host target gene. HGF BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by HGF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HGF BINDING SITE, designated SEQ ID:45221, to the nucleotide sequence of VGAM1631 RNA, herein designated VGAM RNA, also designated SEQ ID:4342.

[55267] A function of VGAM1631 is therefore inhibition of Hepatocyte Growth Factor (hepatopoietin A; scatter factor) (HGF, Accession XM\_168542), a gene which may be required for normal embryonic development; strongly similar to murine Hgf, has kringle domains. Accordingly, utilities of VGAM1631 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HGF. The function of HGF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM174. Muscleblind-like (Drosophila) (MBNL, Accession NM\_021038) is another VGAM1631 host target gene. MBNL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MBNL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of MBNL BINDING SITE, designated SEQ ID:22028, to the nucleotide sequence of VGAM1631 RNA, herein designated VGAM RNA, also designated SEQ ID:4342.

[55268] Another function of VGAM1631 is therefore inhibition of Muscleblind-like (Drosophila) (MBNL, Accession NM\_021038), a gene which binds to cug triplet repeat expansion dsrna (by similarity). Accordingly, utilities of VGAM1631 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MBNL. The function of MBNL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM95. Protein Phosphatase 3 (formerly 2B), Regulatory Subunit B, 19kDa, Alpha Isoform (calcineurin B, type I) (PPP3R1, Accession XM\_084103) is another VGAM1631 host target gene. PPP3R1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP3R1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP3R1 BINDING SITE, designated SEQ ID:37530, to the nucleotide sequence of

VGAM1631 RNA, herein designated VGAM RNA, also designated SEQ ID:4342.

[55269] Another function of VGAM1631 is therefore inhibition of Protein Phosphatase 3 (formerly 2B), Regulatory Subunit B, 19kDa, Alpha Isoform (calcineurin B, type I) (PPP3R1, Accession XM\_084103), a gene which is a regulatory subunit of calcineurin, a calcium-dependent, calmodulin stimulated protein phosphatase 3. Accordingly, utilities of VGAM1631 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP3R1. The function of PPP3R1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM323.LOC116068 (Accession XM\_057302) is another VGAM1631 host target gene. LOC116068 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC116068, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC116068 BINDING SITE, designated SEQ ID:36500, to the nucleotide sequence of VGAM1631 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4342.

[55270] Another function of VGAM1631 is therefore inhibition of LOC116068 (Accession XM\_057302). Accordingly, utilities of VGAM1631 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116068. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1632 (VGAM1632) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[55271] VGAM1632 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1632 was detected is described hereinabove with reference to Figs. 1–8.

[55272] VGAM1632 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Herpesvirus 4. VGAM1632 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[55273] VGAM1632 gene encodes a VGAM1632 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM1632 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1632 precursor RNA is designated SEQ ID:1618, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1618 is located at position 85979 relative to the genome of Bovine Herpesvirus 4.

- [55274] VGAM1632 precursor RNA folds onto itself, forming VGAM1632 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [55275] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1632 folded precursor RNA into VGAM1632 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1632 RNA is designated SEQ ID:4343, and is provided hereinbelow with reference to the sequence listing part.

[55276] VGAM1632 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1632 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1632 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[55277] VGAM1632 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1632 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1632 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1632 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1632 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[55278] The complementary binding of VGAM1632 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1632 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1632 host target RNA into VGAM1632 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[55279] It is appreciated that VGAM1632 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1632 host target genes. The mRNA of

each one of this plurality of VGAM1632 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1632 RNA, herein designated VGAM RNA, and which when bound by VGAM1632 RNA causes inhibition of translation of respective one or more VGAM1632 host target proteins.

[55280] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1632 gene, herein designated VGAM GENE, on one or more VGAM1632 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[55281] It is yet further appreciated that a function of VGAM1632 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1632 include diagnosis, prevention and treatment of viral infection by Bovine Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1632 correlate with, and may be deduced from, the identity of the host target genes which VGAM1632 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[55282] Nucleotide sequences of the VGAM1632 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1632 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1632 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1632 are further described hereinbelow with reference to Table 1.

[55283] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1632 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1632 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[55284] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1632 gene, herein designated VGAM is inhibition of expression of VGAM1632 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1632 correlate with, and may be deduced from, the identity of the target genes which VGAM1632 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[55285] Rho GTPase Activating Protein 6 (ARHGAP6, Accession NM\_001174) is a VGAM1632 host target gene. ARHGAP6 BINDING SITE1 and ARHGAP6 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ARHGAP6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGAP6 BINDING SITE1 and ARHGAP6 BINDING SITE2, designated SEQ ID:6838 and SEQ ID:15082 respectively, to the nucleotide sequence of VGAM1632 RNA, herein designated VGAM RNA, also designated SEQ ID:4343.

[55286] A function of VGAM1632 is therefore inhibition of Rho

GTPase Activating Protein 6 (ARHGAP6, Accession NM\_001174), a gene which activates the rho-type GTPases by converting them to an inactive GTP-bound state. Accordingly, utilities of VGAM1632 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGAP6. The function of ARHGAP6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55.FLJ10743 (Accession NM\_018201) is another VGAM1632 host target gene. FLJ10743 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10743, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10743 BINDING SITE, designated SEQ ID:20075, to the nucleotide sequence of VGAM1632 RNA, herein designated VGAM RNA, also designated SEQ ID:4343.

[55287] Another function of VGAM1632 is therefore inhibition of FLJ10743 (Accession NM\_018201). Accordingly, utilities of VGAM1632 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ10743. Homocysteine-inducible, Endoplasmic Reticulum Stress-inducible, Ubiquitin-like Domain Member 1 (HERPUD1, Accession NM\_014685) is another VGAM1632 host target gene. HERPUD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HERPUD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HERPUD1 BINDING SITE, designated SEQ ID:16186, to the nucleotide sequence of VGAM1632 RNA, herein designated VGAM RNA, also designated SEQ ID:4343.

[55288] Another function of VGAM1632 is therefore inhibition of Homocysteine-inducible, Endoplasmic Reticulum Stress-inducible, Ubiquitin-like Domain Member 1 (HERPUD1, Accession NM\_014685). Accordingly, utilities of VGAM1632 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HERPUD1. Zinc Finger Protein 95 Homolog (mouse) (ZFP95, Accession NM\_014569) is another VGAM1632 host target gene. ZFP95 BINDING SITE1 and ZFP95 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ZFP95, corresponding to HOST TAR-

GET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZFP95 BINDING SITE1 and ZFP95 BINDING SITE2, designated SEQ ID:15920 and SEQ ID:29710 respectively, to the nucleotide sequence of VGAM1632 RNA, herein designated VGAM RNA, also designated SEQ ID:4343.

[55289] Another function of VGAM1632 is therefore inhibition of Zinc Finger Protein 95 Homolog (mouse) (ZFP95, Accession NM\_014569). Accordingly, utilities of VGAM1632 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFP95. LOC255030 (Accession XM\_173197) is another VGAM1632 host target gene. LOC255030 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255030, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255030 BINDING SITE, designated SEQ ID:46439, to the nucleotide sequence of VGAM1632 RNA, herein designated VGAM RNA, also designated SEQ ID:4343.

[55290] Another function of VGAM1632 is therefore inhibition of

LOC255030 (Accession XM\_173197). Accordingly, utilities of VGAM1632 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255030. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1633 (VGAM1633) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[55291] VGAM1633 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1633 was detected is described hereinabove with reference to Figs. 1-8.

[55292] VGAM1633 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Herpesvirus 4. VGAM1633 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[55293] VGAM1633 gene encodes a VGAM1633 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1633 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1633 precursor RNA is designated SEQ ID:1619, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1619 is located at position 85246 relative to the genome of Bovine Herpesvirus 4.

- [55294] VGAM1633 precursor RNA folds onto itself, forming VGAM1633 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [55295] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1633 folded precursor RNA into VGAM1633 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide se-

quence of VGAM1633 RNA is designated SEQ ID:4344, and is provided hereinbelow with reference to the sequence listing part.

[55296] VGAM1633 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1633 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1633 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[55297] VGAM1633 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1633 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1633 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM1633 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1633 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[55298] The complementary binding of VGAM1633 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1633 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1633 host target RNA into VGAM1633 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[55299] It is appreciated that VGAM1633 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1633 host target genes. The mRNA of each one of this plurality of VGAM1633 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1633 RNA, herein designated VGAM RNA, and which when bound by VGAM1633 RNA causes inhibition of translation of respective one or more VGAM1633 host target proteins.

[55300] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1633 gene, herein designated VGAM GENE, on one or more VGAM1633 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[55301] It is yet further appreciated that a function of VGAM1633

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1633 include diagnosis, prevention and treatment of viral infection by Bovine Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1633 correlate with, and may be deduced from, the identity of the host target genes which VGAM1633 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[55302] Nucleotide sequences of the VGAM1633 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1633 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1633 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1633 are further described hereinbelow with reference to Table 1.

[55303] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1633 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1633 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[55304] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1633 gene, herein designated VGAM is inhibition of expression of VGAM1633 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1633 correlate with, and may be deduced from, the identity of the target genes which VGAM1633 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[55305] RAB Interacting Factor (RABIF, Accession NM\_002871) is a VGAM1633 host target gene. RABIF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RABIF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RABIF BINDING SITE, designated SEQ ID:8779, to the nucleotide sequence of VGAM1633 RNA, herein designated VGAM RNA, also designated SEQ ID:4344.

[55306] A function of VGAM1633 is therefore inhibition of RAB Interacting Factor (RABIF, Accession NM\_002871), a gene which is involved in the regulation of intracellular vesicular transport. Accordingly, utilities of VGAM1633 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with RABIF. The function of RABIF has been established by previous studies. The Sec4/Rab-related small GTP-binding proteins are involved in the regulation of intracellular vesicular transport. Mss4 stimulates GTP-GDP exchange in Sec4 and Rab and binds to a subset of genetically related Rab proteins. Yu and Schreiber (1995) cloned a human MSS4 cDNA. The gene encodes a 123-amino acid polypeptide that requires zinc for stability. Muller-Pillasch et al. (1997) showed by Northern blot analysis that MSS4 is expressed as 3 differently sized mRNAs, probably due to alternative polyadenylation signals. The transcripts are present at barely detectable levels in healthy pancreas, but at much higher levels in pancreatic and other cancer tissues. Muller-Pillasch et al. (1997) used fluorescence in situ hybridization to map the MSS4 gene to human chromosome 1q32-q41.

[55307] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[55308] Muller-Pillasch, F.; Zimmerhackl, F.; Lacher, U.; Schultz, N.; Hameister, H.; Varga, G.; Friess, H.; Buchler, M.; Adler, G.; Gress, T. M. : Cloning of novel transcripts of the hu-

man guanine–nucleotide–exchange factor Mss4: in situ chromosomal mapping and expression in pancreatic cancer. Genomics 46: 389–396, 1997. ; and

[55309] Yu, H.; Schreiber, S. L. : Cloning, Zn(2+) binding, and structural characterization of the guanine nucleotide exchange factor human Mss4. Biochemistry 34: 9103–9110, 1995.

[55310] Further studies establishing the function and utilities of RABIF are found in John Hopkins OMIM database record ID 603417, and in cited publications numbered 8184–8185 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. KIAA0596 (Accession XM\_031706) is another VGAM1633 host target gene. KIAA0596 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0596, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0596 BINDING SITE, designated SEQ ID:31461, to the nucleotide sequence of VGAM1633 RNA, herein designated VGAM RNA, also designated SEQ ID:4344.

[55311] Another function of VGAM1633 is therefore inhibition of

KIAA0596 (Accession XM\_031706). Accordingly, utilities of VGAM1633 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0596. LOC144501 (Accession XM\_096612) is another VGAM1633 host target gene. LOC144501 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144501, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144501 BINDING SITE, designated SEQ ID:40425, to the nucleotide sequence of VGAM1633 RNA, herein designated VGAM RNA, also designated SEQ ID:4344.

[55312] Another function of VGAM1633 is therefore inhibition of LOC144501 (Accession XM\_096612). Accordingly, utilities of VGAM1633 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144501. LOC163412 (Accession XM\_088868) is another VGAM1633 host target gene. LOC163412 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC163412, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC163412 BINDING SITE, designated SEQ ID:39955, to the nucleotide sequence of VGAM1633 RNA, herein designated VGAM RNA, also designated SEQ ID:4344.

[55313] Another function of VGAM1633 is therefore inhibition of LOC163412 (Accession XM\_088868). Accordingly, utilities of VGAM1633 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163412. LOC222182 (Accession XM\_168471) is another VGAM1633 host target gene. LOC222182 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222182, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222182 BINDING SITE, designated SEQ ID:45197, to the nucleotide sequence of VGAM1633 RNA, herein designated VGAM RNA, also designated SEQ ID:4344.

[55314] Another function of VGAM1633 is therefore inhibition of LOC222182 (Accession XM\_168471). Accordingly, utilities of VGAM1633 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222182. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1634 (VGAM1634) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[55315] VGAM1634 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1634 was detected is described hereinabove with reference to Figs. 1–8.

[55316] VGAM1634 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Herpesvirus 4. VGAM1634 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[55317] VGAM1634 gene encodes a VGAM1634 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1634 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1634 precursor RNA is designated SEQ ID:1620, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:1620 is located at position 81295 relative to the genome of Bovine Herpesvirus 4.

[55318] VGAM1634 precursor RNA folds onto itself, forming VGAM1634 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[55319] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1634 folded precursor RNA into VGAM1634 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1634 RNA is designated SEQ ID:4345, and is provided hereinbelow with reference to the sequence listing part.

[55320] VGAM1634 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1634 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1634 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[55321] VGAM1634 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1634 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1634 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1634 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1634 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[55322] The complementary binding of VGAM1634 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1634 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1634 host target RNA into VGAM1634 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[55323] It is appreciated that VGAM1634 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1634 host target genes. The mRNA of each one of this plurality of VGAM1634 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1634 RNA, herein designated VGAM RNA, and which when bound by VGAM1634 RNA causes inhibition of translation of respective one or more

VGAM1634 host target proteins.

[55324] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1634 gene, herein designated VGAM GENE, on one or more VGAM1634 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[55325] It is yet further appreciated that a function of VGAM1634 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1634 include diagnosis, prevention and treatment of viral infection by Bovine Herpesvirus 4. Spe-

cific functions, and accordingly utilities, of VGAM1634 correlate with, and may be deduced from, the identity of the host target genes which VGAM1634 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[55326] Nucleotide sequences of the VGAM1634 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1634 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1634 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1634 are further described hereinbelow with reference to Table 1.

[55327] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1634 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1634 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[55328] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1634 gene, herein designated VGAM is inhibition of expression of VGAM1634 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM1634 correlate with, and may be deduced from, the identity of the target genes which VGAM1634 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[55329] Nuclear Receptor Subfamily 5, Group A, Member 2 (NR5A2, Accession NM\_003822) is a VGAM1634 host target gene. NR5A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NR5A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NR5A2 BINDING SITE, designated SEQ ID:9915, to the nucleotide sequence of VGAM1634 RNA, herein designated VGAM RNA, also designated SEQ ID:4345.

[55330] A function of VGAM1634 is therefore inhibition of Nuclear Receptor Subfamily 5, Group A, Member 2 (NR5A2, Accession NM\_003822), a gene which is a member of nuclear receptor superfamily of transcriptional activators and activates the hepatitis B virus (HBV) promoter. Accordingly, utilities of VGAM1634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NR5A2. The function of NR5A2 and its association

with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM375. Wingless-type MMTV Integration Site Family, Member 3A (WNT3A, Accession NM\_033131) is another VGAM1634 host target gene. WNT3A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by WNT3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WNT3A BINDING SITE, designated SEQ ID:26973, to the nucleotide sequence of VGAM1634 RNA, herein designated VGAM RNA, also designated SEQ ID:4345.

[55331] Another function of VGAM1634 is therefore inhibition of Wingless-type MMTV Integration Site Family, Member 3A (WNT3A, Accession NM\_033131). Accordingly, utilities of VGAM1634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WNT3A. CDC14 Cell Division Cycle 14 Homolog B (*S. cerevisiae*) (CDC14B, Accession NM\_033332) is another VGAM1634 host target gene. CDC14B BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by CDC14B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDC14B BINDING SITE, designated SEQ ID:27166, to the nucleotide sequence of VGAM1634 RNA, herein designated VGAM RNA, also designated SEQ ID:4345.

[55332] Another function of VGAM1634 is therefore inhibition of CDC14 Cell Division Cycle 14 Homolog B (*S. cerevisiae*) (CDC14B, Accession NM\_033332). Accordingly, utilities of VGAM1634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDC14B. KIAA1656 (Accession XM\_038022) is another VGAM1634 host target gene. KIAA1656 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1656, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1656 BINDING SITE, designated SEQ ID:32727, to the nucleotide sequence of VGAM1634 RNA, herein designated VGAM RNA, also designated SEQ ID:4345.

[55333] Another function of VGAM1634 is therefore inhibition of

KIAA1656 (Accession XM\_038022). Accordingly, utilities of VGAM1634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1656. PRO1914 (Accession NM\_014106) is another VGAM1634 host target gene. PRO1914 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRO1914, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1914 BINDING SITE, designated SEQ ID:15329, to the nucleotide sequence of VGAM1634 RNA, herein designated VGAM RNA, also designated SEQ ID:4345.

[55334] Another function of VGAM1634 is therefore inhibition of PRO1914 (Accession NM\_014106). Accordingly, utilities of VGAM1634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1914. PRO2859 (Accession NM\_018543) is another VGAM1634 host target gene. PRO2859 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRO2859, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of PRO2859 BINDING SITE, designated SEQ ID:20616, to the nucleotide sequence of VGAM1634 RNA, herein designated VGAM RNA, also designated SEQ ID:4345.

[55335] Another function of VGAM1634 is therefore inhibition of PRO2859 (Accession NM\_018543). Accordingly, utilities of VGAM1634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2859. RDH-E2 (Accession NM\_138969) is another VGAM1634 host target gene. RDH-E2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RDH-E2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RDH-E2 BINDING SITE, designated SEQ ID:29079, to the nucleotide sequence of VGAM1634 RNA, herein designated VGAM RNA, also designated SEQ ID:4345.

[55336] Another function of VGAM1634 is therefore inhibition of RDH-E2 (Accession NM\_138969). Accordingly, utilities of VGAM1634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RDH-E2. LOC131583 (Accession XM\_067456) is another

VGAM1634 host target gene. LOC131583 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC131583, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC131583 BINDING SITE, designated SEQ ID:37356, to the nucleotide sequence of VGAM1634 RNA, herein designated VGAM RNA, also designated SEQ ID:4345.

[55337] Another function of VGAM1634 is therefore inhibition of LOC131583 (Accession XM\_067456). Accordingly, utilities of VGAM1634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC131583. LOC204593 (Accession XM\_119002) is another VGAM1634 host target gene. LOC204593 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC204593, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC204593 BINDING SITE, designated SEQ ID:43583, to the nucleotide sequence of VGAM1634 RNA, herein designated VGAM RNA, also designated SEQ ID:4345.

[55338] Another function of VGAM1634 is therefore inhibition of LOC204593 (Accession XM\_119002). Accordingly, utilities of VGAM1634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC204593. LOC254042 (Accession XM\_171022) is another VGAM1634 host target gene. LOC254042 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254042, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254042 BINDING SITE, designated SEQ ID:45791, to the nucleotide sequence of VGAM1634 RNA, herein designated VGAM RNA, also designated SEQ ID:4345.

[55339] Another function of VGAM1634 is therefore inhibition of LOC254042 (Accession XM\_171022). Accordingly, utilities of VGAM1634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254042. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1635 (VGAM1635) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[55340] VGAM1635 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1635 was detected is described hereinabove with reference to Figs. 1–8.

[55341] VGAM1635 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 8. VGAM1635 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[55342] VGAM1635 gene encodes a VGAM1635 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1635 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1635 precursor RNA is designated SEQ ID:1621, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1621 is located at position 121659 relative to the genome of Human Herpesvirus 8.

[55343] VGAM1635 precursor RNA folds onto itself, forming VGAM1635 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[55344] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1635 folded precursor RNA into VGAM1635 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM1635 RNA is designated SEQ ID:4346, and is provided hereinbelow with reference to the sequence listing part.

[55345] VGAM1635 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1635 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1635 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[55346] VGAM1635 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1635 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1635 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1635 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1635 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[55347] The complementary binding of VGAM1635 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1635 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1635 host target RNA into VGAM1635 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[55348] It is appreciated that VGAM1635 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1635 host target genes. The mRNA of each one of this plurality of VGAM1635 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1635 RNA, herein designated VGAM RNA, and which when bound by VGAM1635 RNA causes inhibition of translation of respective one or more VGAM1635 host target proteins.

[55349] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1635 gene, herein designated VGAM GENE, on one or more VGAM1635 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[55350] It is yet further appreciated that a function of VGAM1635 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1635 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 8. Specific functions, and accordingly utilities, of VGAM1635 correlate with, and may be deduced from, the identity of the host target genes which VGAM1635 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[55351] Nucleotide sequences of the VGAM1635 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1635 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1635 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1635 are further described hereinbelow with reference to Table 1.

[55352] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1635 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1635 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[55353] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1635 gene, herein designated VGAM is inhibition of expression of VGAM1635 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1635 correlate with, and may be deduced from, the identity of the target genes which VGAM1635 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[55354] Crn, Crooked Neck-like 1 (Drosophila) (CRNKL1, Accession NM\_016652) is a VGAM1635 host target gene. CRNKL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CRNKL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRNKL1 BINDING SITE, designated SEQ ID:18771, to the nucleotide sequence of VGAM1635 RNA, herein designated VGAM RNA, also designated SEQ ID:4346.

[55355] A function of VGAM1635 is therefore inhibition of Crn, Crooked Neck-like 1 (Drosophila) (CRNKL1, Accession NM\_016652). Accordingly, utilities of VGAM1635 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRNKL1. KIAA1190 (Accession XM\_048695) is another VGAM1635 host target gene. KIAA1190 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1190, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1190 BINDING SITE, designated

SEQ ID:35223, to the nucleotide sequence of VGAM1635 RNA, herein designated VGAM RNA, also designated SEQ ID:4346.

[55356] Another function of VGAM1635 is therefore inhibition of KIAA1190 (Accession XM\_048695). Accordingly, utilities of VGAM1635 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1190. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1636 (VGAM1636) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[55357] VGAM1636 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1636 was detected is described hereinabove with reference to Figs. 1–8.

[55358] VGAM1636 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 8. VGAM1636 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[55359] VGAM1636 gene encodes a VGAM1636 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1636 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1636 precursor RNA is designated SEQ ID:1622, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1622 is located at position 119152 relative to the genome of Human Herpesvirus 8.

[55360] VGAM1636 precursor RNA folds onto itself, forming VGAM1636 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[55361] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1636 folded precursor RNA into VGAM1636 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM1636 RNA is designated SEQ ID:4347, and is provided hereinbelow with reference to the sequence listing part.

[55362] VGAM1636 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1636 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1636 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[55363] VGAM1636 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1636 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1636 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1636 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1636 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[55364] The complementary binding of VGAM1636 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1636 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1636 host target RNA into VGAM1636 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[55365] It is appreciated that VGAM1636 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1636 host target genes. The mRNA of each one of this plurality of VGAM1636 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1636 RNA, herein designated VGAM RNA, and which when bound by VGAM1636 RNA causes inhibition of translation of respective one or more VGAM1636 host target proteins.

[55366] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1636 gene, herein designated VGAM GENE, on one or more VGAM1636 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,  
`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[55367] It is yet further appreciated that a function of VGAM1636 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 8. Specific functions, and accordingly utilities, of VGAM1636 correlate with, and may be deduced from, the identity of the host target genes which VGAM1636 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[55368] Nucleotide sequences of the VGAM1636 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1636 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1636 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1636 are further described hereinbelow with reference to Table 1.

[55369] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1636 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM1636 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[55370] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1636 gene, herein designated VGAM is inhibition of expression of VGAM1636 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1636 correlate with, and may be deduced from, the identity of the target genes which VGAM1636 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[55371] Core-binding Factor, Runt Domain, Alpha Subunit 2; Translocated To, 2 (CBFA2T2, Accession NM\_005093) is a VGAM1636 host target gene. CBFA2T2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CBFA2T2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CBFA2T2 BINDING SITE, designated SEQ ID:11545, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55372] A function of VGAM1636 is therefore inhibition of Core-binding Factor, Runt Domain, Alpha Subunit 2; Translocated To, 2 (CBFA2T2, Accession NM\_005093), a gene which is a putative transcription factor. Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBFA2T2. The function of CBFA2T2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM152. DNA Fragmentation Factor, 40kDa, Beta Polypeptide (caspase-activated DNase) (DFFB, Accession XM\_113366) is another VGAM1636 host target gene. DFFB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DFFB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DFFB BINDING SITE, designated SEQ ID:42236, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55373] Another function of VGAM1636 is therefore inhibition of DNA Fragmentation Factor, 40kDa, Beta Polypeptide

(caspase-activated DNase) (DFFB, Accession XM\_113366), a gene which induces DNA fragmentation and chromatin condensation during apoptosis. Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DFFB. The function of DFFB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74. Deleted In Lung and Esophageal Cancer 1 (DLEC1, Accession NM\_007336) is another VGAM1636 host target gene. DLEC1 BINDING SITE1 and DLEC1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DLEC1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DLEC1 BINDING SITE1 and DLEC1 BINDING SITE2, designated SEQ ID:14261 and SEQ ID:14267 respectively, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55374] Another function of VGAM1636 is therefore inhibition of Deleted In Lung and Esophageal Cancer 1 (DLEC1, Accession NM\_007336). Accordingly, utilities of VGAM1636 in-

clude diagnosis, prevention and treatment of diseases and clinical conditions associated with DLEC1. Mediterranean Fever (MEFV, Accession NM\_000243) is another VGAM1636 host target gene. MEFV BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MEFV, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEFV BINDING SITE, designated SEQ ID:5766, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55375] Another function of VGAM1636 is therefore inhibition of Mediterranean Fever (MEFV, Accession NM\_000243). Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEFV. MHC Class I Polypeptide-related Sequence B (MICB, Accession NM\_005931) is another VGAM1636 host target gene. MICB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MICB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MICB BINDING SITE, designated SEQ ID:5767, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

tarity of the nucleotide sequences of MICB BINDING SITE, designated SEQ ID:12563, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55376] Another function of VGAM1636 is therefore inhibition of MHC Class I Polypeptide-related Sequence B (MICB, Accession NM\_005931), a gene which involved in the presentation of foreign antigens to the immune system. Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MICB. The function of MICB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74. Melan-A (MLANA, Accession NM\_005511) is another VGAM1636 host target gene. MLANA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MLANA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MLANA BINDING SITE, designated SEQ ID:12026, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ

ID:4347.

[55377] Another function of VGAM1636 is therefore inhibition of Melan-A (MLANA, Accession NM\_005511). Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MLANA. NDRG Family Member 3 (NDRG3, Accession NM\_032013) is another VGAM1636 host target gene. NDRG3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NDRG3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NDRG3 BINDING SITE, designated SEQ ID:25719, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55378] Another function of VGAM1636 is therefore inhibition of NDRG Family Member 3 (NDRG3, Accession NM\_032013). Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NDRG3. NAD(P)H Dehydrogenase, Quinone 1 (NQO1, Accession NM\_000903) is another VGAM1636 host target gene. NQO1 BINDING SITE is HOST

TARGET binding site found in the 3` untranslated region of mRNA encoded by NQO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NQO1 BINDING SITE, designated SEQ ID:6604, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55379] Another function of VGAM1636 is therefore inhibition of NAD(P)H Dehydrogenase, Quinone 1 (NQO1, Accession NM\_000903), a gene which is cytochrome b5 reductase which reduces redox dyes and quinones. Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NQO1. The function of NQO1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM923. Pre-B-cell Leukemia Transcription Factor 2 (PBX2, Accession NM\_002586) is another VGAM1636 host target gene. PBX2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PBX2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PBX2 BINDING SITE, designated SEQ ID:8449, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55380] Another function of VGAM1636 is therefore inhibition of Pre-B-cell Leukemia Transcription Factor 2 (PBX2, Accession NM\_002586), a gene which binds the sequence 5'-atcaatcaa-3'. Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PBX2. The function of PBX2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1063. Period Homolog 2 (Drosophila) (PER2, Accession NM\_022817) is another VGAM1636 host target gene. PER2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PER2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PER2 BINDING SITE, designated SEQ ID:23089, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA,

also designated SEQ ID:4347.

[55381] Another function of VGAM1636 is therefore inhibition of Period Homolog 2 (Drosophila) (PER2, Accession NM\_022817), a gene which Period homolog 2; putative circadian clock protein; has a PAS dimerization domain. Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PER2. The function of PER2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74. Palmitoyl-protein Thioesterase 1 (ceroid-lipofuscinosis, neuronal 1, infantile) (PPT1, Accession XM\_029842) is another VGAM1636 host target gene. PPT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPT1 BINDING SITE, designated SEQ ID:30954, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55382] Another function of VGAM1636 is therefore inhibition of

Palmitoyl-protein Thioesterase 1 (ceroid-lipofuscinosis, neuronal 1, infantile) (PPT1, Accession XM\_029842). Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPT1. Proteasome (prosome, macropain) 26S Subunit, Non-ATPase, 9 (PSMD9, Accession NM\_002813) is another VGAM1636 host target gene. PSMD9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PSMD9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSMD9 BINDING SITE, designated SEQ ID:8677, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55383] Another function of VGAM1636 is therefore inhibition of Proteasome (prosome, macropain) 26S Subunit, Non-ATPase, 9 (PSMD9, Accession NM\_002813), a gene which acts as a regulatory subunit of the 26 proteasome. Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSMD9. The function of PSMD9 has been

established by previous studies. The 26S proteasome is a eukaryotic ATP-dependent protease that selectively degrades intracellular target proteins that are modified by the covalent attachment of ubiquitin. It is composed of a central catalytic 20S proteasome, which consists of a family of small proteins, and 2 large regulatory modules, named PA700, which consist of approximately 20 heterogeneous proteins. A proteasomal modulator complex, composed of p27, p42, and p50 subunits, stimulates the association of the 20S proteasome with PA700 to form the active 26S proteasome. Watanabe et al. (1998) cloned 2 distinct human brain cDNAs encoding p27, or PSMD9. Compared with the longer cDNA, the shorter cDNA has a 65-bp deletion near the 3-prime region that results in a new inframe termination codon farther downstream. The longer cDNA encodes a deduced 209-amino acid protein with a calculated molecular mass of 22,764 Da. The shorter cDNA encodes a deduced 223-amino acid protein with a calculated molecular mass of 24,652 Da. The longer PSMD9 protein exhibits 36% sequence identity with an *S. cerevisiae* protein, which the authors named NAS2 for 'non-ATPase subunit 2,' and 31.9% identity with a *C. elegans* protein. Disruption of the yeast NAS2 gene did

not affect cell viability or proliferation. Watanabe et al. (1998) demonstrated that the PSMD9 protein, along with the ATPase components TBP1 (PSMC3; 186852) and p42 (PSMC6; 602708), associated with both the modulator complex and the 26S proteasome complex. Northern blot analysis detected an approximately 1.3-kb PSMD9 transcript in all tissues examined, with highest levels in liver and kidney. E12 and E47 (see OMIM Ref. No. TCF3; 147141), members of the ubiquitous E2A protein family, function with basic helix-loop-helix (bHLH) proteins to bind and transactivate promoters via conserved sequence elements known as E boxes. By yeast 2-hybrid screening of a rat insulinoma cell cDNA library using the bHLH domain-containing C terminus of E12 as bait, Thomas et al. (1999) obtained a cDNA encoding rat Bridge-1. Sequence analysis predicted that the 222-amino acid Bridge-1 protein shares 98% amino acid similarity with human PSMD9 over the first 184 amino acids but diverges in the C terminus. Bridge-1 contains a PDZ-like domain from amino acids 138 to 178, forming 3 beta sheets and 2 alpha helices. SDS-PAGE analysis showed that Bridge-1 is expressed as a 28-kD protein, close to the deduced value of 25 kD. Using Bridge-1 cDNA as probe, Northern blot anal-

ysis detected a 1.0-kb transcript in all rat and human tissues tested, with highest expression in pancreas, testis, kidney, and liver. Immunocytochemistry assessment demonstrated predominant nuclear localization of Bridge-1, with lower levels in cytoplasm. Immunoprecipitation analysis determined that anti-Bridge-1 coimmunoprecipitates E12 or E12 and E47 through their C-terminal bHLH domains, but only in the presence of the PDZ domain of Bridge-1. CAT assays indicated that Bridge-1 together with E12 or E47 coactivates insulin (OMIM Ref. No. 176730) promoter elements.

[55384] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[55385] Thomas, M. K.; Yao, K.-M.; Tenser, M. S.; Wong, G. G.; Habener, J. F. : Bridge-1, a novel PDZ-domain coactivator of E2A-mediated regulation of insulin gene transcription. *Molec. Cell. Biol.* 19: 8492-8504, 1999. ; and

[55386] Watanabe, T. K.; Saito, A.; Suzuki, M.; Fujiwara, T.; Takahashi, E.; Slaughter, C. A.; DeMartino, G. N.; Hendil, K. B.; Chung, C. H.; Tanahashi, N.; Tanaka, K. : cDNA cloning and chara.

[55387] Further studies establishing the function and utilities of

PSMD9 are found in John Hopkins OMIM database record ID 603146, and in cited publications numbered 5426–5427 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Sex Comb On Midleg-like 2 (Drosophila) (SCML2, Accession NM\_006089) is another VGAM1636 host target gene. SCML2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SCML2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCML2 BINDING SITE, designated SEQ ID:12733, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55388] Another function of VGAM1636 is therefore inhibition of Sex Comb On Midleg-like 2 (Drosophila) (SCML2, Accession NM\_006089). Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCML2. Selenoprotein X, 1 (SEPX1, Accession NM\_016332) is another VGAM1636 host target gene. SEPX1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA

encoded by SEPX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEPX1 BINDING SITE, designated SEQ ID:18456, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55389] Another function of VGAM1636 is therefore inhibition of Selenoprotein X, 1 (SEPX1, Accession NM\_016332). Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEPX1. Sulfotransferase Family, Cytosolic, 2B, Member 1 (SULT2B1, Accession NM\_004605) is another VGAM1636 host target gene. SULT2B1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SULT2B1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SULT2B1 BINDING SITE, designated SEQ ID:10948, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55390] Another function of VGAM1636 is therefore inhibition of

Sulfotransferase Family, Cytosolic, 2B, Member 1 (SULT2B1, Accession NM\_004605). Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SULT2B1. Von Hippel–Lindau Syndrome (VHL, Accession NM\_000551) is another VGAM1636 host target gene. VHL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VHL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VHL BINDING SITE, designated SEQ ID:6154, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55391] Another function of VGAM1636 is therefore inhibition of Von Hippel–Lindau Syndrome (VHL, Accession NM\_000551), a gene which may control rna stability through the selective degradation of rna-bound proteins. Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VHL. The function of VHL and its association with various diseases and clinical conditions, has been established by previous studies, as described here–

in above with reference to VGAM197. Activating Transcription Factor 3 (ATF3, Accession NM\_004024) is another VGAM1636 host target gene. ATF3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATF3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATF3 BINDING SITE, designated SEQ ID:10246, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55392] Another function of VGAM1636 is therefore inhibition of Activating Transcription Factor 3 (ATF3, Accession NM\_004024). Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATF3. BOP (Accession XM\_097915) is another VGAM1636 host target gene. BOP BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by BOP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BOP BINDING SITE, designated SEQ ID:41209, to the nu-

cleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55393] Another function of VGAM1636 is therefore inhibition of BOP (Accession XM\_097915). Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BOP. CED-6 (Accession NM\_016315) is another VGAM1636 host target gene. CED-6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CED-6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CED-6 BINDING SITE, designated SEQ ID:18429, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55394] Another function of VGAM1636 is therefore inhibition of CED-6 (Accession NM\_016315). Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CED-6. CXYorf1 (Accession XM\_088704) is another VGAM1636 host target gene. CXYorf1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by CXYorf1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CXYorf1 BINDING SITE, designated SEQ ID:39912, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55395] Another function of VGAM1636 is therefore inhibition of CXYorf1 (Accession XM\_088704). Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CXYorf1. DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 34 (DDX34, Accession NM\_014681) is another VGAM1636 host target gene. DDX34 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DDX34, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDX34 BINDING SITE, designated SEQ ID:16168, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55396] Another function of VGAM1636 is therefore inhibition of

DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 34 (DDX34, Accession NM\_014681). Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX34. Ecotropic Viral Integration Site 5 (EVI5, Accession NM\_005665) is another VGAM1636 host target gene. EVI5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EVI5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EVI5 BINDING SITE, designated SEQ ID:12205, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55397] Another function of VGAM1636 is therefore inhibition of Ecotropic Viral Integration Site 5 (EVI5, Accession NM\_005665). Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EVI5. FBP17 (Accession XM\_052666) is another VGAM1636 host target gene. FBP17 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FBP17, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBP17 BINDING SITE, designated SEQ ID:36045, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55398] Another function of VGAM1636 is therefore inhibition of FBP17 (Accession XM\_052666). Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBP17. FLJ10159 (Accession NM\_018013) is another VGAM1636 host target gene. FLJ10159 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10159, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10159 BINDING SITE, designated SEQ ID:19747, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55399] Another function of VGAM1636 is therefore inhibition of FLJ10159 (Accession NM\_018013). Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ10159. FLJ12363 (Accession NM\_032167) is another VGAM1636 host target gene. FLJ12363 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12363, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12363 BINDING SITE, designated SEQ ID:25864, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55400] Another function of VGAM1636 is therefore inhibition of FLJ12363 (Accession NM\_032167). Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12363. FLJ12816 (Accession NM\_022060) is another VGAM1636 host target gene. FLJ12816 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12816, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12816 BINDING SITE, designated SEQ ID:22605, to the nucleotide

sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55401] Another function of VGAM1636 is therefore inhibition of FLJ12816 (Accession NM\_022060). Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12816. FLJ12891 (Accession NM\_024950) is another VGAM1636 host target gene. FLJ12891 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12891, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12891 BINDING SITE, designated SEQ ID:24508, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55402] Another function of VGAM1636 is therefore inhibition of FLJ12891 (Accession NM\_024950). Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12891. FLJ20241 (Accession NM\_017721) is another VGAM1636 host target gene. FLJ20241 BINDING SITE is HOST TARGET binding site found in the 5' untranslated

region of mRNA encoded by FLJ20241, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20241 BINDING SITE, designated SEQ ID:19311, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55403] Another function of VGAM1636 is therefore inhibition of FLJ20241 (Accession NM\_017721). Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20241. FLJ21168 (Accession NM\_025073) is another VGAM1636 host target gene. FLJ21168 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21168, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21168 BINDING SITE, designated SEQ ID:24670, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55404] Another function of VGAM1636 is therefore inhibition of FLJ21168 (Accession NM\_025073). Accordingly, utilities of

VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21168. FLJ22684 (Accession NM\_025048) is another VGAM1636 host target gene. FLJ22684 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22684, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22684 BINDING SITE, designated SEQ ID:24642, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55405] Another function of VGAM1636 is therefore inhibition of FLJ22684 (Accession NM\_025048). Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22684. KIAA0161 (Accession NM\_014746) is another VGAM1636 host target gene. KIAA0161 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0161, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA0161 BINDING SITE, designated SEQ ID:16427, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55406] Another function of VGAM1636 is therefore inhibition of KIAA0161 (Accession NM\_014746). Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0161. KIAA0391 (Accession NM\_014672) is another VGAM1636 host target gene. KIAA0391 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0391, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0391 BINDING SITE, designated SEQ ID:16133, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55407] Another function of VGAM1636 is therefore inhibition of KIAA0391 (Accession NM\_014672). Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0391. KIAA0472 (Accession XM\_050147) is another VGAM1636 host target gene. KIAA0472 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0472, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0472 BINDING SITE, designated SEQ ID:35581, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55408] Another function of VGAM1636 is therefore inhibition of KIAA0472 (Accession XM\_050147). Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0472. KIAA1170 (Accession XM\_045907) is another VGAM1636 host target gene. KIAA1170 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1170, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1170 BINDING SITE, designated SEQ ID:34609, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55409] Another function of VGAM1636 is therefore inhibition of

KIAA1170 (Accession XM\_045907). Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1170. KIAA1198 (Accession XM\_032674) is another VGAM1636 host target gene. KIAA1198 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1198, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1198 BINDING SITE, designated SEQ ID:31699, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55410] Another function of VGAM1636 is therefore inhibition of KIAA1198 (Accession XM\_032674). Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1198. KIAA1493 (Accession XM\_034415) is another VGAM1636 host target gene. KIAA1493 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1493, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1493 BINDING SITE, designated SEQ ID:32085, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55411] Another function of VGAM1636 is therefore inhibition of KIAA1493 (Accession XM\_034415). Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1493. KIAA1712 (Accession XM\_041497) is another VGAM1636 host target gene. KIAA1712 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1712, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1712 BINDING SITE, designated SEQ ID:33535, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55412] Another function of VGAM1636 is therefore inhibition of KIAA1712 (Accession XM\_041497). Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1712. MGC35558 (Accession NM\_145013) is another

VGAM1636 host target gene. MGC35558 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC35558, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC35558 BINDING SITE, designated SEQ ID:29615, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55413] Another function of VGAM1636 is therefore inhibition of MGC35558 (Accession NM\_145013). Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC35558. MGC4730 (Accession XM\_034644) is another VGAM1636 host target gene. MGC4730 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4730, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4730 BINDING SITE, designated SEQ ID:32134, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55414] Another function of VGAM1636 is therefore inhibition of MGC4730 (Accession XM\_034644). Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4730. PIP3-E (Accession XM\_039749) is another VGAM1636 host target gene. PIP3-E BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PIP3-E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIP3-E BINDING SITE, designated SEQ ID:33173, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55415] Another function of VGAM1636 is therefore inhibition of PIP3-E (Accession XM\_039749). Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIP3-E. PRO2955 (Accession NM\_018545) is another VGAM1636 host target gene. PRO2955 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO2955, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2955 BINDING SITE, designated SEQ ID:20619, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55416] Another function of VGAM1636 is therefore inhibition of PRO2955 (Accession NM\_018545). Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2955. Proline-serine-threonine Phosphatase Interacting Protein 2 (PSTPIP2, Accession NM\_024430) is another VGAM1636 host target gene. PSTPIP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PSTPIP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSTPIP2 BINDING SITE, designated SEQ ID:23678, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55417] Another function of VGAM1636 is therefore inhibition of Proline-serine-threonine Phosphatase Interacting Protein 2 (PSTPIP2, Accession NM\_024430). Accordingly, utilities

of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSTPIP2. Ubiquitin-conjugating Enzyme E2 Variant 2 (UBE2V2, Accession NM\_003350) is another VGAM1636 host target gene. UBE2V2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UBE2V2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBE2V2 BINDING SITE, designated SEQ ID:9376, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55418] Another function of VGAM1636 is therefore inhibition of Ubiquitin-conjugating Enzyme E2 Variant 2 (UBE2V2, Accession NM\_003350). Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE2V2. VDU1 (Accession NM\_015017) is another VGAM1636 host target gene. VDU1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VDU1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Ta-

ble 2 illustrates the complementarity of the nucleotide sequences of VDU1 BINDING SITE, designated SEQ ID:17380, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55419] Another function of VGAM1636 is therefore inhibition of VDU1 (Accession NM\_015017). Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VDU1. Vacuolar Protein Sorting 33A (yeast) (VPS33A, Accession NM\_022916) is another VGAM1636 host target gene. VPS33A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VPS33A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VPS33A BINDING SITE, designated SEQ ID:23229, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55420] Another function of VGAM1636 is therefore inhibition of Vacuolar Protein Sorting 33A (yeast) (VPS33A, Accession NM\_022916). Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with VPS33A. Williams–Beuren Syndrome Chromosome Region 23 (WBSCR23, Accession NM\_025042) is another VGAM1636 host target gene. WBSCR23 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by WBSCR23, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WBSCR23 BINDING SITE, designated SEQ ID:24636, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55421] Another function of VGAM1636 is therefore inhibition of Williams–Beuren Syndrome Chromosome Region 23 (WBSCR23, Accession NM\_025042). Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WBSCR23. LOC133362 (Accession XM\_068305) is another VGAM1636 host target gene. LOC133362 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC133362, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC133362 BINDING SITE, designated SEQ ID:37380, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55422] Another function of VGAM1636 is therefore inhibition of LOC133362 (Accession XM\_068305). Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC133362. LOC143916 (Accession XM\_084664) is another VGAM1636 host target gene. LOC143916 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC143916, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143916 BINDING SITE, designated SEQ ID:37649, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55423] Another function of VGAM1636 is therefore inhibition of LOC143916 (Accession XM\_084664). Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143916. LOC144524 (Accession XM\_096624) is an-

other VGAM1636 host target gene. LOC144524 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC144524, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144524 BINDING SITE, designated SEQ ID:40432, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55424] Another function of VGAM1636 is therefore inhibition of LOC144524 (Accession XM\_096624). Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144524. LOC146229 (Accession XM\_085387) is another VGAM1636 host target gene. LOC146229 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146229, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146229 BINDING SITE, designated SEQ ID:38103, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55425] Another function of VGAM1636 is therefore inhibition of LOC146229 (Accession XM\_085387). Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146229. LOC149711 (Accession XM\_097720) is another VGAM1636 host target gene. LOC149711 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149711, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149711 BINDING SITE, designated SEQ ID:41066, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55426] Another function of VGAM1636 is therefore inhibition of LOC149711 (Accession XM\_097720). Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149711. LOC169611 (Accession XM\_095809) is another VGAM1636 host target gene. LOC169611 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC169611, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC169611 BINDING SITE, designated SEQ ID:40284, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55427] Another function of VGAM1636 is therefore inhibition of LOC169611 (Accession XM\_095809). Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC169611. LOC196047 (Accession XM\_116883) is another VGAM1636 host target gene. LOC196047 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC196047, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196047 BINDING SITE, designated SEQ ID:43142, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55428] Another function of VGAM1636 is therefore inhibition of LOC196047 (Accession XM\_116883). Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC196047. LOC196510 (Accession XM\_113738) is another VGAM1636 host target gene. LOC196510 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196510, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196510 BINDING SITE, designated SEQ ID:42392, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55429] Another function of VGAM1636 is therefore inhibition of LOC196510 (Accession XM\_113738). Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196510. LOC199699 (Accession XM\_113990) is another VGAM1636 host target gene. LOC199699 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199699, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199699 BINDING SITE, designated SEQ ID:42593, to the nucleotide sequence of VGAM1636 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4347.

[55430] Another function of VGAM1636 is therefore inhibition of LOC199699 (Accession XM\_113990). Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199699. LOC199958 (Accession XM\_117163) is another VGAM1636 host target gene. LOC199958 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199958, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199958 BINDING SITE, designated SEQ ID:43263, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55431] Another function of VGAM1636 is therefore inhibition of LOC199958 (Accession XM\_117163). Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199958. LOC200093 (Accession XM\_032184) is another VGAM1636 host target gene. LOC200093 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200093, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200093 BINDING SITE, designated SEQ ID:31604, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55432] Another function of VGAM1636 is therefore inhibition of LOC200093 (Accession XM\_032184). Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200093. LOC200220 (Accession XM\_114157) is another VGAM1636 host target gene. LOC200220 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200220, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200220 BINDING SITE, designated SEQ ID:42741, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55433] Another function of VGAM1636 is therefore inhibition of LOC200220 (Accession XM\_114157). Accordingly, utilities of VGAM1636 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC200220. LOC220074 (Accession NM\_145309) is another VGAM1636 host target gene. LOC220074 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220074, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220074 BINDING SITE, designated SEQ ID:29821, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55434] Another function of VGAM1636 is therefore inhibition of LOC220074 (Accession NM\_145309). Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220074. LOC222160 (Accession XM\_168431) is another VGAM1636 host target gene. LOC222160 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222160, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222160 BINDING SITE, designated SEQ ID:45163, to

the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55435] Another function of VGAM1636 is therefore inhibition of LOC222160 (Accession XM\_168431). Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222160. LOC256364 (Accession XM\_170672) is another VGAM1636 host target gene. LOC256364 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256364, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256364 BINDING SITE, designated SEQ ID:45444, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55436] Another function of VGAM1636 is therefore inhibition of LOC256364 (Accession XM\_170672). Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256364. LOC91040 (Accession XM\_035641) is another VGAM1636 host target gene. LOC91040 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC91040, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91040 BINDING SITE, designated SEQ ID:32321, to the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, also designated SEQ ID:4347.

[55437] Another function of VGAM1636 is therefore inhibition of LOC91040 (Accession XM\_035641). Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91040. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1637 (VGAM1637) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[55438] VGAM1637 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1637 was detected is described hereinabove with reference to Figs. 1-8.

[55439] VGAM1637 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Human Herpesvirus 8. VGAM1637 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[55440] VGAM1637 gene encodes a VGAM1637 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1637 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1637 precursor RNA is designated SEQ ID:1623, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1623 is located at position 122480 relative to the genome of Human Herpesvirus 8.

[55441] VGAM1637 precursor RNA folds onto itself, forming VGAM1637 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[55442] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1637 folded precursor RNA into VGAM1637 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 63%) nucleotide sequence of VGAM1637 RNA is designated SEQ ID:4348, and is provided hereinbelow with reference to the sequence listing part.

[55443] VGAM1637 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1637 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1637 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[55444] VGAM1637 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1637 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1637 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1637 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1637 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[55445] The complementary binding of VGAM1637 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1637 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1637

host target RNA into VGAM1637 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[55446] It is appreciated that VGAM1637 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1637 host target genes. The mRNA of each one of this plurality of VGAM1637 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1637 RNA, herein designated VGAM RNA, and which when bound by VGAM1637 RNA causes inhibition of translation of respective one or more VGAM1637 host target proteins.

[55447] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1637 gene, herein designated VGAM GENE, on one or more VGAM1637 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[55448] It is yet further appreciated that a function of VGAM1637 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1637 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 8. Specific functions, and accordingly utilities, of VGAM1637 correlate with, and may be deduced from, the identity of the host target genes which VGAM1637 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[55449] Nucleotide sequences of the VGAM1637 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1637 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1637 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1637 are further

described hereinbelow with reference to Table 1.

[55450] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1637 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1637 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[55451] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1637 gene, herein designated VGAM is inhibition of expression of VGAM1637 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1637 correlate with, and may be deduced from, the identity of the target genes which VGAM1637 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[55452] Golgi Reassembly Stacking Protein 1, 65kDa (GORASP1, Accession NM\_031899) is a VGAM1637 host target gene. GORASP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GORASP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of GORASP1 BINDING SITE, designated SEQ ID:25643, to the nucleotide sequence of VGAM1637 RNA, herein designated VGAM RNA, also designated SEQ ID:4348.

[55453] A function of VGAM1637 is therefore inhibition of Golgi Reassembly Stacking Protein 1, 65kDa (GORASP1, Accession NM\_031899), a gene which has some function with the Golgi apparatus. Accordingly, utilities of VGAM1637 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GORASP1. The function of GORASP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM630.KIAA0884 (Accession XM\_046660) is another VGAM1637 host target gene. KIAA0884 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0884, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0884 BINDING SITE, designated SEQ ID:34771, to the nucleotide sequence of VGAM1637 RNA, herein designated VGAM RNA, also designated SEQ ID:4348.

[55454] Another function of VGAM1637 is therefore inhibition of KIAA0884 (Accession XM\_046660). Accordingly, utilities of VGAM1637 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0884. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1638 (VGAM1638) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[55455] VGAM1638 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1638 was detected is described hereinabove with reference to Figs. 1–8.

[55456] VGAM1638 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 8. VGAM1638 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[55457] VGAM1638 gene encodes a VGAM1638 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM1638 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1638 precursor RNA is designated SEQ ID:1624, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1624 is located at position 124374 relative to the genome of Human Herpesvirus 8.

[55458] VGAM1638 precursor RNA folds onto itself, forming VGAM1638 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[55459] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1638 folded precursor RNA into VGAM1638 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 56%) nucleotide sequence of VGAM1638 RNA is designated SEQ ID:4349, and is provided hereinbelow with reference to the sequence listing part.

[55460] VGAM1638 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1638 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1638 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[55461] VGAM1638 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1638 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1638 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1638 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1638 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[55462] The complementary binding of VGAM1638 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1638 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1638 host target RNA into VGAM1638 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[55463] It is appreciated that VGAM1638 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1638 host target genes. The mRNA of each one of this plurality of VGAM1638 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1638 RNA, herein designated VGAM RNA, and which when bound by VGAM1638 RNA causes inhibition of translation of respective one or more VGAM1638 host target proteins.

[55464] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1638 gene, herein designated VGAM GENE, on one or more VGAM1638 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[55465] It is yet further appreciated that a function of VGAM1638 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1638 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 8. Specific functions, and accordingly utilities, of VGAM1638 correlate with, and may be deduced from, the identity of the host target genes which VGAM1638 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[55466] Nucleotide sequences of the VGAM1638 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1638 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1638 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1638 are further described hereinbelow with reference to Table 1.

[55467] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1638 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1638 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[55468] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1638 gene, herein designated VGAM is inhibition of expression of VGAM1638 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1638 correlate with, and may be deduced from, the identity of the target genes which VGAM1638 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[55469] MLL Septin-like Fusion (MSF, Accession XM\_113892) is a VGAM1638 host target gene. MSF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MSF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MSF BINDING SITE, designated SEQ ID:42519, to the nucleotide sequence of VGAM1638 RNA, herein designated VGAM RNA, also designated SEQ ID:4349.

[55470] A function of VGAM1638 is therefore inhibition of MLL Septin-like Fusion (MSF, Accession XM\_113892), a gene which plays a role in the cell cycle. Accordingly, utilities of VGAM1638 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with MSF. The function of MSF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM514. Phosphorylase, Glycogen; Brain (PYGB, Accession NM\_002862) is another VGAM1638 host target gene. PYGB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PYGB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PYGB BINDING SITE, designated SEQ ID:8763, to the nucleotide sequence of VGAM1638 RNA, herein designated VGAM RNA, also designated SEQ ID:4349.

[55471] Another function of VGAM1638 is therefore inhibition of Phosphorylase, Glycogen; Brain (PYGB, Accession NM\_002862). Accordingly, utilities of VGAM1638 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PYGB. Chromosome 20 Open Reading Frame 108 (C20orf108, Accession NM\_080821) is another VGAM1638 host target gene. C20orf108 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

C20orf108, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf108 BINDING SITE, designated SEQ ID:28086, to the nucleotide sequence of VGAM1638 RNA, herein designated VGAM RNA, also designated SEQ ID:4349.

[55472] Another function of VGAM1638 is therefore inhibition of Chromosome 20 Open Reading Frame 108 (C20orf108, Accession NM\_080821). Accordingly, utilities of VGAM1638 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf108. FLJ10378 (Accession NM\_018078) is another VGAM1638 host target gene. FLJ10378 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ10378, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10378 BINDING SITE, designated SEQ ID:19839, to the nucleotide sequence of VGAM1638 RNA, herein designated VGAM RNA, also designated SEQ ID:4349.

[55473] Another function of VGAM1638 is therefore inhibition of

FLJ10378 (Accession NM\_018078). Accordingly, utilities of VGAM1638 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10378. HDCMA18P (Accession NM\_016648) is another VGAM1638 host target gene. HDCMA18P BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HDCMA18P, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HDCMA18P BINDING SITE, designated SEQ ID:18766, to the nucleotide sequence of VGAM1638 RNA, herein designated VGAM RNA, also designated SEQ ID:4349.

[55474] Another function of VGAM1638 is therefore inhibition of HDCMA18P (Accession NM\_016648). Accordingly, utilities of VGAM1638 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HDCMA18P. KIAA0164 (Accession NM\_014739) is another VGAM1638 host target gene. KIAA0164 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0164, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0164 BINDING SITE, designated SEQ ID:16403, to the nucleotide sequence of VGAM1638 RNA, herein designated VGAM RNA, also designated SEQ ID:4349.

[55475] Another function of VGAM1638 is therefore inhibition of KIAA0164 (Accession NM\_014739). Accordingly, utilities of VGAM1638 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0164. SNF1 Sucrose Nonfermenting Like Kinase (yeast) (SLK, Accession NM\_014720) is another VGAM1638 host target gene. SLK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLK BINDING SITE, designated SEQ ID:16282, to the nucleotide sequence of VGAM1638 RNA, herein designated VGAM RNA, also designated SEQ ID:4349.

[55476] Another function of VGAM1638 is therefore inhibition of SNF1 Sucrose Nonfermenting Like Kinase (yeast) (SLK, Accession NM\_014720). Accordingly, utilities of VGAM1638 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with SLK. LOC144811 (Accession XM\_096681) is another VGAM1638 host target gene. LOC144811 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC144811, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144811 BINDING SITE, designated SEQ ID:40454, to the nucleotide sequence of VGAM1638 RNA, herein designated VGAM RNA, also designated SEQ ID:4349.

[55477] Another function of VGAM1638 is therefore inhibition of LOC144811 (Accession XM\_096681). Accordingly, utilities of VGAM1638 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144811. LOC145786 (Accession XM\_096860) is another VGAM1638 host target gene. LOC145786 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145786, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145786 BINDING SITE, designated SEQ ID:40592, to

the nucleotide sequence of VGAM1638 RNA, herein designated VGAM RNA, also designated SEQ ID:4349.

[55478] Another function of VGAM1638 is therefore inhibition of LOC145786 (Accession XM\_096860). Accordingly, utilities of VGAM1638 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145786. LOC158696 (Accession XM\_088644) is another VGAM1638 host target gene. LOC158696 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158696, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158696 BINDING SITE, designated SEQ ID:39880, to the nucleotide sequence of VGAM1638 RNA, herein designated VGAM RNA, also designated SEQ ID:4349.

[55479] Another function of VGAM1638 is therefore inhibition of LOC158696 (Accession XM\_088644). Accordingly, utilities of VGAM1638 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158696. LOC254556 (Accession XM\_170588) is another VGAM1638 host target gene. LOC254556 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC254556, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254556 BINDING SITE, designated SEQ ID:45391, to the nucleotide sequence of VGAM1638 RNA, herein designated VGAM RNA, also designated SEQ ID:4349.

[55480] Another function of VGAM1638 is therefore inhibition of LOC254556 (Accession XM\_170588). Accordingly, utilities of VGAM1638 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254556. LOC257415 (Accession XM\_171177) is another VGAM1638 host target gene. LOC257415 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257415, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257415 BINDING SITE, designated SEQ ID:45958, to the nucleotide sequence of VGAM1638 RNA, herein designated VGAM RNA, also designated SEQ ID:4349.

[55481] Another function of VGAM1638 is therefore inhibition of LOC257415 (Accession XM\_171177). Accordingly, utilities

of VGAM1638 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257415. LOC90342 (Accession XM\_031009) is another VGAM1638 host target gene. LOC90342 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90342, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90342 BINDING SITE, designated SEQ ID:31254, to the nucleotide sequence of VGAM1638 RNA, herein designated VGAM RNA, also designated SEQ ID:4349.

[55482] Another function of VGAM1638 is therefore inhibition of LOC90342 (Accession XM\_031009). Accordingly, utilities of VGAM1638 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90342. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1639 (VGAM1639) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[55483] VGAM1639 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1639 was detected is described hereinabove with reference to Figs. 1–8.

[55484] VGAM1639 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 8. VGAM1639 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[55485] VGAM1639 gene encodes a VGAM1639 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1639 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1639 precursor RNA is designated SEQ ID:1625, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1625 is located at position 121407 relative to the genome of Human Herpesvirus 8.

[55486] VGAM1639 precursor RNA folds onto itself, forming VGAM1639 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[55487] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1639 folded precursor RNA into VGAM1639 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM1639 RNA is designated SEQ ID:4350, and is provided hereinbelow with reference to the sequence listing part.

[55488] VGAM1639 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1639 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1639 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[55489] VGAM1639 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1639 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1639 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1639 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1639 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[55490] The complementary binding of VGAM1639 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1639 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1639 host target RNA into VGAM1639 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[55491] It is appreciated that VGAM1639 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1639 host target genes. The mRNA of each one of this plurality of VGAM1639 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1639 RNA, herein designated VGAM RNA, and which when bound by VGAM1639 RNA causes inhibition of translation of respective one or more VGAM1639 host target proteins.

[55492] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1639 gene, herein designated VGAM GENE, on one or more VGAM1639 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[55493] It is yet further appreciated that a function of VGAM1639 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1639 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 8. Specific functions, and accordingly utilities, of VGAM1639 correlate with, and may be deduced from, the identity of the host target genes which VGAM1639 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[55494] Nucleotide sequences of the VGAM1639 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the  
`diced` VGAM1639 RNA, herein designated VGAM RNA,  
and a schematic representation of the secondary folding  
of VGAM1639 folded precursor RNA, herein designated  
VGAM FOLDED PRECURSOR RNA, of VGAM1639 are further  
described hereinbelow with reference to Table 1.

[55495] Nucleotide sequences of host target binding sites, such as  
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of  
Fig. 1, found on VGAM1639 host target RNA, and  
schematic representation of the complementarity of each  
of these host target binding sites to VGAM1639 RNA,  
herein designated VGAM RNA, are described hereinbelow  
with reference to Table 2.

[55496] As mentioned hereinabove with reference to Fig. 1, a  
function of VGAM1639 gene, herein designated VGAM is  
inhibition of expression of VGAM1639 target genes. It is  
appreciated that specific functions, and accordingly utili-  
ties, of VGAM1639 correlate with, and may be deduced  
from, the identity of the target genes which VGAM1639  
binds and inhibits, and the function of these target genes,  
as elaborated hereinbelow.

[55497] LOC114971 (Accession XM\_054936) is a VGAM1639 host  
target gene. LOC114971 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by LOC114971, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC114971 BINDING SITE, designated SEQ ID:36206, to the nucleotide sequence of VGAM1639 RNA, herein designated VGAM RNA, also designated SEQ ID:4350.

[55498] A function of VGAM1639 is therefore inhibition of LOC114971 (Accession XM\_054936). Accordingly, utilities of VGAM1639 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC114971. LOC221773 (Accession XM\_165802) is another VGAM1639 host target gene. LOC221773 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221773, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221773 BINDING SITE, designated SEQ ID:43759, to the nucleotide sequence of VGAM1639 RNA, herein designated VGAM RNA, also designated SEQ ID:4350.

[55499] Another function of VGAM1639 is therefore inhibition of

LOC221773 (Accession XM\_165802). Accordingly, utilities of VGAM1639 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221773. LOC255533 (Accession XM\_173073) is another VGAM1639 host target gene. LOC255533 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255533, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255533 BINDING SITE, designated SEQ ID:46326, to the nucleotide sequence of VGAM1639 RNA, herein designated VGAM RNA, also designated SEQ ID:4350.

[55500] Another function of VGAM1639 is therefore inhibition of LOC255533 (Accession XM\_173073). Accordingly, utilities of VGAM1639 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255533. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1640 (VGAM1640) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[55501] VGAM1640 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1640 was detected is described hereinabove with reference to Figs. 1–8.

[55502] VGAM1640 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 8. VGAM1640 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[55503] VGAM1640 gene encodes a VGAM1640 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1640 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1640 precursor RNA is designated SEQ ID:1626, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1626 is located at position 117446 relative to the genome of Human Herpesvirus 8.

[55504] VGAM1640 precursor RNA folds onto itself, forming VGAM1640 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two–

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[55505] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1640 folded precursor RNA into VGAM1640 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM1640 RNA is designated SEQ ID:4351, and is provided hereinbelow with reference to the sequence listing part.

[55506] VGAM1640 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1640 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1640 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[55507] VGAM1640 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1640 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1640 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1640 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1640 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[55508] The complementary binding of VGAM1640 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1640 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1640 host target RNA into VGAM1640 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[55509] It is appreciated that VGAM1640 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1640 host target genes. The mRNA of each one of this plurality of VGAM1640 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1640 RNA, herein designated VGAM RNA, and which when bound by VGAM1640 RNA causes inhibition of translation of respective one or more VGAM1640 host target proteins.

[55510] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1640 gene, herein designated VGAM GENE, on one

or more VGAM1640 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[55511] It is yet further appreciated that a function of VGAM1640 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1640 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 8. Specific functions, and accordingly utilities, of VGAM1640 correlate with, and may be deduced from, the identity of the host target genes which VGAM1640 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[55512] Nucleotide sequences of the VGAM1640 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1640 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1640 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1640 are further described hereinbelow with reference to Table 1.

[55513] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1640 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1640 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[55514] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1640 gene, herein designated VGAM is inhibition of expression of VGAM1640 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1640 correlate with, and may be deduced from, the identity of the target genes which VGAM1640 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[55515] Reticulon 3 (RTN3, Accession XM\_058207) is a VGAM1640

host target gene. RTN3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RTN3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RTN3 BINDING SITE, designated SEQ ID:36586, to the nucleotide sequence of VGAM1640 RNA, herein designated VGAM RNA, also designated SEQ ID:4351.

[55516] A function of VGAM1640 is therefore inhibition of Reticulon 3 (RTN3, Accession XM\_058207), a gene which is a member of the reticulon (neuroendocrine-specific, NSP) family. Accordingly, utilities of VGAM1640 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RTN3. The function of RTN3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM596. Tuftelin 1 (TUFT1, Accession NM\_020127) is another VGAM1640 host target gene. TUFT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TUFT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TUFT1 BINDING SITE, designated SEQ ID:21320, to the nucleotide sequence of VGAM1640 RNA, herein designated VGAM RNA, also designated SEQ ID:4351.

[55517] Another function of VGAM1640 is therefore inhibition of Tuftelin 1 (TUFT1, Accession NM\_020127), a gene which appears to play a role in cytokinesis, cell shape, and specialized functions such as secretion and capping. Accordingly, utilities of VGAM1640 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TUFT1. The function of TUFT1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1152. Chromosome 6 Open Reading Frame 33 (C6orf33, Accession NM\_133367) is another VGAM1640 host target gene. C6orf33 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C6orf33, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C6orf33 BINDING SITE, designated SEQ ID:28494, to the

nucleotide sequence of VGAM1640 RNA, herein designated VGAM RNA, also designated SEQ ID:4351.

[55518] Another function of VGAM1640 is therefore inhibition of Chromosome 6 Open Reading Frame 33 (C6orf33, Accession NM\_133367). Accordingly, utilities of VGAM1640 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C6orf33. FLJ23191 (Accession NM\_024574) is another VGAM1640 host target gene. FLJ23191 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ23191, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23191 BINDING SITE, designated SEQ ID:23805, to the nucleotide sequence of VGAM1640 RNA, herein designated VGAM RNA, also designated SEQ ID:4351.

[55519] Another function of VGAM1640 is therefore inhibition of FLJ23191 (Accession NM\_024574). Accordingly, utilities of VGAM1640 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23191. FLJ30213 (Accession NM\_145008) is another VGAM1640 host target gene. FLJ30213 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ30213, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ30213 BINDING SITE, designated SEQ ID:29610, to the nucleotide sequence of VGAM1640 RNA, herein designated VGAM RNA, also designated SEQ ID:4351.

[55520] Another function of VGAM1640 is therefore inhibition of FLJ30213 (Accession NM\_145008). Accordingly, utilities of VGAM1640 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ30213. KIAA1184 (Accession NM\_022572) is another VGAM1640 host target gene. KIAA1184 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1184, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1184 BINDING SITE, designated SEQ ID:22898, to the nucleotide sequence of VGAM1640 RNA, herein designated VGAM RNA, also designated SEQ ID:4351.

[55521] Another function of VGAM1640 is therefore inhibition of

KIAA1184 (Accession NM\_022572). Accordingly, utilities of VGAM1640 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1184. NDP52 (Accession NM\_005831) is another VGAM1640 host target gene. NDP52 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NDP52, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NDP52 BINDING SITE, designated SEQ ID:12442, to the nucleotide sequence of VGAM1640 RNA, herein designated VGAM RNA, also designated SEQ ID:4351.

[55522] Another function of VGAM1640 is therefore inhibition of NDP52 (Accession NM\_005831). Accordingly, utilities of VGAM1640 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NDP52. Trinucleotide Repeat Containing 6 (TNRC6, Accession XM\_047123) is another VGAM1640 host target gene. TNRC6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TNRC6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of TNRC6 BINDING SITE, designated SEQ ID:34901, to the nucleotide sequence of VGAM1640 RNA, herein designated VGAM RNA, also designated SEQ ID:4351.

[55523] Another function of VGAM1640 is therefore inhibition of Trinucleotide Repeat Containing 6 (TNRC6, Accession XM\_047123). Accordingly, utilities of VGAM1640 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNRC6. LOC129676 (Accession XM\_065341) is another VGAM1640 host target gene. LOC129676 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC129676, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC129676 BINDING SITE, designated SEQ ID:37287, to the nucleotide sequence of VGAM1640 RNA, herein designated VGAM RNA, also designated SEQ ID:4351.

[55524] Another function of VGAM1640 is therefore inhibition of LOC129676 (Accession XM\_065341). Accordingly, utilities of VGAM1640 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC129676. LOC152905 (Accession XM\_017966) is another VGAM1640 host target gene. LOC152905 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152905, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152905 BINDING SITE, designated SEQ ID:30331, to the nucleotide sequence of VGAM1640 RNA, herein designated VGAM RNA, also designated SEQ ID:4351.

[55525] Another function of VGAM1640 is therefore inhibition of LOC152905 (Accession XM\_017966). Accordingly, utilities of VGAM1640 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152905. LOC254402 (Accession XM\_174207) is another VGAM1640 host target gene. LOC254402 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254402, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254402 BINDING SITE, designated SEQ ID:46583, to

the nucleotide sequence of VGAM1640 RNA, herein designated VGAM RNA, also designated SEQ ID:4351.

[55526] Another function of VGAM1640 is therefore inhibition of LOC254402 (Accession XM\_174207). Accordingly, utilities of VGAM1640 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254402. LOC56267 (Accession NM\_019610) is another VGAM1640 host target gene. LOC56267 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC56267, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC56267 BINDING SITE, designated SEQ ID:21230, to the nucleotide sequence of VGAM1640 RNA, herein designated VGAM RNA, also designated SEQ ID:4351.

[55527] Another function of VGAM1640 is therefore inhibition of LOC56267 (Accession NM\_019610). Accordingly, utilities of VGAM1640 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC56267. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 1641 (VGAM1641) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[55528] VGAM1641 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1641 was detected is described hereinabove with reference to Figs. 1–8.

[55529] VGAM1641 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cell Fusing Agent Virus. VGAM1641 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[55530] VGAM1641 gene encodes a VGAM1641 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1641 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1641 precursor RNA is designated SEQ ID:1627, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1627 is located at position 9147 relative to the genome of Cell Fusing Agent Virus.

[55531] VGAM1641 precursor RNA folds onto itself, forming VGAM1641 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[55532] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1641 folded precursor RNA into VGAM1641 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1641 RNA is designated SEQ ID:4352, and is provided hereinbelow with reference to the sequence listing part.

[55533] VGAM1641 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1641 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1641 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[55534] VGAM1641 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1641 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1641 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1641 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1641 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[55535] The complementary binding of VGAM1641 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1641 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1641 host target RNA into VGAM1641 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[55536] It is appreciated that VGAM1641 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1641 host target genes. The mRNA of each one of this plurality of VGAM1641 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1641 RNA, herein designated VGAM RNA, and which when bound by VGAM1641 RNA causes inhibition of translation of respective one or more VGAM1641 host target proteins.

[55537] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1641 gene, herein designated VGAM GENE, on one or more VGAM1641 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[55538] It is yet further appreciated that a function of VGAM1641 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1641 include diagnosis, prevention and treatment of viral infection by Cell Fusing Agent Virus. Specific functions, and accordingly utilities, of VGAM1641 correlate with, and may be deduced from, the identity of

the host target genes which VGAM1641 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[55539] Nucleotide sequences of the VGAM1641 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1641 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1641 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1641 are further described hereinbelow with reference to Table 1.

[55540] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1641 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1641 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[55541] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1641 gene, herein designated VGAM is inhibition of expression of VGAM1641 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1641 correlate with, and may be deduced from, the identity of the target genes which VGAM1641

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[55542] Hepatocyte Growth Factor (hepapoietin A; scatter factor) (HGF, Accession XM\_168542) is a VGAM1641 host target gene. HGF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HGF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HGF BINDING SITE, designated SEQ ID:45219, to the nucleotide sequence of VGAM1641 RNA, herein designated VGAM RNA, also designated SEQ ID:4352.

[55543] A function of VGAM1641 is therefore inhibition of Hepatocyte Growth Factor (hepapoietin A; scatter factor) (HGF, Accession XM\_168542), a gene which may be required for normal embryonic development; strongly similar to murine Hgf, has kringle domains. Accordingly, utilities of VGAM1641 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HGF. The function of HGF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM174. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1642 (VGAM1642) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[55544] VGAM1642 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1642 was detected is described hereinabove with reference to Figs. 1–8.

[55545] VGAM1642 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cell Fusing Agent Virus. VGAM1642 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[55546] VGAM1642 gene encodes a VGAM1642 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1642 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1642 precursor RNA is designated SEQ ID:1628, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:1628 is located at position 8550 relative to the genome of Cell Fusing Agent Virus.

[55547] VGAM1642 precursor RNA folds onto itself, forming VGAM1642 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[55548] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1642 folded precursor RNA into VGAM1642 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1642 RNA is designated SEQ ID:4353, and is provided hereinbelow with reference to the sequence listing part.

[55549] VGAM1642 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1642 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1642 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[55550] VGAM1642 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1642 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1642 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1642 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1642 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[55551] The complementary binding of VGAM1642 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1642 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1642 host target RNA into VGAM1642 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[55552] It is appreciated that VGAM1642 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1642 host target genes. The mRNA of each one of this plurality of VGAM1642 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1642 RNA, herein designated VGAM RNA, and which when bound by VGAM1642 RNA causes inhibition of translation of respective one or more

VGAM1642 host target proteins.

[55553] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1642 gene, herein designated VGAM GENE, on one or more VGAM1642 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[55554] It is yet further appreciated that a function of VGAM1642 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1642 include diagnosis, prevention and treatment of viral infection by Cell Fusing Agent Virus.

Specific functions, and accordingly utilities, of VGAM1642 correlate with, and may be deduced from, the identity of the host target genes which VGAM1642 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[55555] Nucleotide sequences of the VGAM1642 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1642 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1642 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1642 are further described hereinbelow with reference to Table 1.

[55556] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1642 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1642 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[55557] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1642 gene, herein designated VGAM is inhibition of expression of VGAM1642 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM1642 correlate with, and may be deduced from, the identity of the target genes which VGAM1642 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[55558] LOC254122 (Accession XM\_170660) is a VGAM1642 host target gene. LOC254122 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254122, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254122 BINDING SITE, designated SEQ ID:45437, to the nucleotide sequence of VGAM1642 RNA, herein designated VGAM RNA, also designated SEQ ID:4353.

[55559] A function of VGAM1642 is therefore inhibition of LOC254122 (Accession XM\_170660). Accordingly, utilities of VGAM1642 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254122. LOC254830 (Accession XM\_175118) is another VGAM1642 host target gene. LOC254830 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254830, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254830 BINDING SITE, designated SEQ ID:46612, to the nucleotide sequence of VGAM1642 RNA, herein designated VGAM RNA, also designated SEQ ID:4353.

[55560] Another function of VGAM1642 is therefore inhibition of LOC254830 (Accession XM\_175118). Accordingly, utilities of VGAM1642 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254830. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1643 (VGAM1643) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[55561] VGAM1643 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1643 was detected is described hereinabove with reference to Figs. 1-8.

[55562] VGAM1643 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cell Fusing Agent Virus. VGAM1643 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[55563] VGAM1643 gene encodes a VGAM1643 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1643 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1643 precursor RNA is designated SEQ ID:1629, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1629 is located at position 1340 relative to the genome of Cell Fusing Agent Virus.

[55564] VGAM1643 precursor RNA folds onto itself, forming VGAM1643 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[55565] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1643 folded precursor RNA into VGAM1643

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1643 RNA is designated SEQ ID:4354, and is provided hereinbelow with reference to the sequence listing part.

[55566] VGAM1643 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1643 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1643 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[55567] VGAM1643 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1643 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1643 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1643 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1643 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[55568] The complementary binding of VGAM1643 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1643 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1643 host target RNA into VGAM1643 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[55569] It is appreciated that VGAM1643 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1643 host target genes. The mRNA of each one of this plurality of VGAM1643 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1643 RNA, herein designated VGAM RNA, and which when bound by VGAM1643 RNA causes inhibition of translation of respective one or more VGAM1643 host target proteins.

[55570] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1643 gene, herein designated VGAM GENE, on one or more VGAM1643 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[55571] It is yet further appreciated that a function of VGAM1643 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1643 include diagnosis, prevention and treatment of viral infection by Cell Fusing Agent Virus. Specific functions, and accordingly utilities, of VGAM1643 correlate with, and may be deduced from, the identity of the host target genes which VGAM1643 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[55572] Nucleotide sequences of the VGAM1643 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1643 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1643 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1643 are further described hereinbelow with reference to Table 1.

[55573] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1643 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1643 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[55574] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1643 gene, herein designated VGAM is inhibition of expression of VGAM1643 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1643 correlate with, and may be deduced from, the identity of the target genes which VGAM1643 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[55575] GNAS Complex Locus (GNAS, Accession NM\_016592) is a VGAM1643 host target gene. GNAS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GNAS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNAS BINDING SITE, designated SEQ ID:18676, to the nucleotide sequence of VGAM1643 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4354.

[55576] A function of VGAM1643 is therefore inhibition of GNAS Complex Locus (GNAS, Accession NM\_016592), a gene which transduces signals from G protein-coupled receptors and activates adenylyl cyclase. Accordingly, utilities of VGAM1643 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNAS. The function of GNAS and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1205. Zinc Finger Protein 43 (HTF6) (ZNF43, Accession NM\_003423) is another VGAM1643 host target gene. ZNF43 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ZNF43, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF43 BINDING SITE, designated SEQ ID:9470, to the nucleotide sequence of VGAM1643 RNA, herein designated VGAM RNA, also designated SEQ ID:4354.

[55577] Another function of VGAM1643 is therefore inhibition of Zinc Finger Protein 43 (HTF6) (ZNF43, Accession

NM\_003423), a gene which may be involved in transcriptional regulation. Accordingly, utilities of VGAM1643 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF43. The function of ZNF43 has been established by previous studies. By screening a cDNA library derived from a human undifferentiated embryonal carcinoma cell line with the coding sequence of the ZNF85 (OMIM Ref. No. 603899) N-terminal nonfinger region, which spans the KRAB domain, Bellefroid et al. (1991) isolated cDNAs encoding 11 distinct KRAB ZNFs, including ZNF43, which they called HTF6. Lovering and Trowsdale (1991) noted that this HTF6 cDNA, which differs from the 2 ZNF43 cDNAs that they isolated, encodes a ZNF lacking the KRAB A box. Bellefroid et al. (1993) reported the characterization of a subgroup of KRAB ZNFs, named the ZNF91 family, of which ZNF43 is a member. These proteins contain a conserved linker region, called the ZNF91-related spacer region, between their N-terminal KRAB domain and their first finger unit. The authors found that members of the ZNF91 family are widely expressed in human tissues, with the highest expression in T-lymphoid cells.

[55578] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[55579] Lovering, R.; Trowsdale, J. : A gene encoding 22 highly related zinc fingers is expressed in lymphoid cell lines. *Nucleic Acids Res.* 19: 2921–2928, 1991. ; and

[55580] Bellefroid, E. J.; Poncelet, D. A.; Lecocq, P. J.; Revelant, O.; Martial, J. A. : The evolutionarily conserved Kruppel-associated box domain defines a subfamily of eukaryotic multifingered.

[55581] Further studies establishing the function and utilities of ZNF43 are found in John Hopkins OMIM database record ID 603972, and in cited publications numbered 7425–742 and 7466 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Leptin Receptor Overlapping Transcript-like 1 (LEPROTL1, Accession NM\_015344) is another VGAM1643 host target gene. LEPROTL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LEPROTL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LEPROTL1 BINDING SITE, designated SEQ ID:17650, to the nucleotide sequence of VGAM1643 RNA,

herein designated VGAM RNA, also designated SEQ ID:4354.

[55582] Another function of VGAM1643 is therefore inhibition of Leptin Receptor Overlapping Transcript-like 1 (LEPROTL1, Accession NM\_015344). Accordingly, utilities of VGAM1643 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LEP-ROTL1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1644 (VGAM1644) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[55583] VGAM1644 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1644 was detected is described hereinabove with reference to Figs. 1-8.

[55584] VGAM1644 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Dengue Virus. VGAM1644 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[55585] VGAM1644 gene encodes a VGAM1644 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1644 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1644 precursor RNA is designated SEQ ID:1630, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1630 is located at position 10625 relative to the genome of Dengue Virus.

[55586] VGAM1644 precursor RNA folds onto itself, forming VGAM1644 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[55587] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1644 folded precursor RNA into VGAM1644 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM1644 RNA is designated SEQ ID:4355, and is provided hereinbelow with reference to the sequence listing part.

[55588] VGAM1644 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1644 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1644 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[55589] VGAM1644 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1644 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1644 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1644 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1644 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[55590] The complementary binding of VGAM1644 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1644 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1644 host target RNA into VGAM1644 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[55591] It is appreciated that VGAM1644 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1644 host target genes. The mRNA of each one of this plurality of VGAM1644 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1644 RNA, herein designated VGAM RNA, and which when bound by VGAM1644 RNA causes inhibition of translation of respective one or more VGAM1644 host target proteins.

[55592] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1644 gene, herein designated VGAM GENE, on one or more VGAM1644 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,  
`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[55593] It is yet further appreciated that a function of VGAM1644 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1644 include diagnosis, prevention and treatment of viral infection by Dengue Virus. Specific functions, and accordingly utilities, of VGAM1644 correlate with, and may be deduced from, the identity of the host target genes which VGAM1644 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[55594] Nucleotide sequences of the VGAM1644 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1644 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1644 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1644 are further described hereinbelow with reference to Table 1.

[55595] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1644 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM1644 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[55596] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1644 gene, herein designated VGAM is inhibition of expression of VGAM1644 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1644 correlate with, and may be deduced from, the identity of the target genes which VGAM1644 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[55597] A Disintegrin-like and Metalloprotease (reprolysin type) with Thrombospondin Type 1 Motif, 5 (aggrecanase-2) (ADAMTS5, Accession NM\_007038) is a VGAM1644 host target gene. ADAMTS5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADAMTS5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAMTS5 BINDING SITE, designated SEQ ID:13918, to the nucleotide sequence of VGAM1644 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4355.

[55598] A function of VGAM1644 is therefore inhibition of A Disintegrin-like and Metalloprotease (reprolysin type) with Thrombospondin Type 1 Motif, 5 (aggrecanase-2) (ADAMTS5, Accession NM\_007038), a gene which cleaves aggrecan, a cartilage proteoglycan, and may be involved in its turnover. Accordingly, utilities of VGAM1644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAMTS5. The function of ADAMTS5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM35. Alkaline Phosphatase, Intestinal (ALPI, Accession NM\_001631) is another VGAM1644 host target gene. ALPI BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ALPI, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALPI BINDING SITE, designated SEQ ID:7345, to the nucleotide sequence of VGAM1644 RNA, herein designated VGAM RNA, also designated SEQ ID:4355.

[55599] Another function of VGAM1644 is therefore inhibition of

Alkaline Phosphatase, Intestinal (ALPI, Accession NM\_001631), a gene which is a glycoprotein phosphatase. Accordingly, utilities of VGAM1644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALPI. The function of ALPI and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM885. Dual Specificity Phosphatase 2 (DUSP2, Accession NM\_004418) is another VGAM1644 host target gene. DUSP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DUSP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DUSP2 BINDING SITE, designated SEQ ID:10682, to the nucleotide sequence of VGAM1644 RNA, herein designated VGAM RNA, also designated SEQ ID:4355.

[55600] Another function of VGAM1644 is therefore inhibition of Dual Specificity Phosphatase 2 (DUSP2, Accession NM\_004418), a gene which regulates mitogenic signal transduction. Accordingly, utilities of VGAM1644 include diagnosis, prevention and treatment of diseases and clinical

cal conditions associated with DUSP2. The function of DUSP2 has been established by previous studies. Mitogenic stimulation of quiescent cells leads to the rapid and reversible activation of mitogen-activated protein (MAP) kinases via dual phosphorylation within a thr-glu-tyr motif. Following activation, MAP kinases translocate into the nucleus where they phosphorylate several signal transduction targets. The dual-specificity phosphatases can reverse MAP kinase activation by dephosphorylating phosphotyrosine and phosphothreonine residues. Rohan et al. (1993) isolated mouse and human cDNAs encoding PAC1, a mitogen-induced 32-kD protein that contains a sequence that is associated with enzymatic activity in previously identified protein phosphotyrosine phosphatases. The predicted human PAC1 protein has 314 amino acids. Northern blot analysis of human cell lines and mouse tissues revealed that PAC1 is expressed predominantly in hematopoietic tissues. By immunofluorescence of transfected cells and mitogen-stimulated T cells, Rohan et al. (1993) localized PAC1 to the nucleus. Ward et al. (1994) demonstrated that PAC1 is a dual-specific thr/tyr phosphatase that is a physiologically relevant MAP kinase phosphatase. Yi et al. (1995) determined that the PAC1, or

DUSP2, gene contains 4 exons that span approximately 2.3 kb. By somatic cell hybrid analysis, linkage analysis, and in situ hybridization, Yi et al. (1995) mapped the PAC1 gene to 2p11.2–q11. Using fluorescence in situ hybridization, Martell et al. (1994) refined the localization of the PAC1 gene to 2q11.

[55601] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[55602] Rohan, P. J.; Davis, P.; Moskaluk, C. A.; Kearns, M.; Krutzsch, H.; Siebenlist, U.; Kelly, K. : PAC–1: a mitogen–induced nuclear protein tyrosine phosphatase. Science 259: 1763–1766, 1993. ; and

[55603] Yi, H.; Morton, C. C.; Weremowicz, S.; McBride, O. W.; Kelly, K. : Genomic organization and chromosomal localization of the DUSP2 gene, encoding a MAP kinase phosphatase, to human 2p11.

[55604] Further studies establishing the function and utilities of DUSP2 are found in John Hopkins OMIM database record ID 603068, and in cited publications numbered 10055–8849 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.FK506 Binding Protein 1B, 12.6 KDa (FKBP1B, Acces–

sion NM\_054033) is another VGAM1644 host target gene. FKBP1B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FKBP1B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FKBP1B BINDING SITE, designated SEQ ID:27643, to the nucleotide sequence of VGAM1644 RNA, herein designated VGAM RNA, also designated SEQ ID:4355.

[55605] Another function of VGAM1644 is therefore inhibition of FK506 Binding Protein 1B, 12.6 KDa (FKBP1B, Accession NM\_054033), a gene which may play a unique physiological role in excitation-contraction coupling in cardiac muscle. Accordingly, utilities of VGAM1644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FKBP1B. The function of FKBP1B has been established by previous studies. Arakawa et al. (1994) isolated a novel gene encoding a protein closely related to the human FK506-binding proteins from a human fetal brain cDNA library. The full-length cDNA encoded an open reading frame of 108 amino acids with 88% identity in predicted amino acid sequence to FKBP12

(OMIM Ref. No. 186945). The FKBP1L gene, designated OTK4 by the authors, also had sequence similarity with other FKBP's in species ranging from prokaryotes to humans, including FKPB13 (OMIM Ref. No. 186946), FKBP25 (OMIM Ref. No. 186947), and FKBP52 (OMIM Ref. No. 600611). Recombinant FKBP1L protein produced in *E. coli* showed peptidyl-prolyl cis-trans isomerase activity like that of other FKBP's. The authors also found an alternatively spliced transcript that contained a 45-bp insertion which included a stop codon. Both transcripts were ubiquitously expressed in several human tissues examined by RT-PCR. The International Radiation Hybrid Mapping Consortium mapped the FKBP1B gene to chromosome 2 (SHGC-31628). Animal model experiments lend further support to the function of FKBP1B. Xin et al. (2002) generated mice deficient in FKBP12.6 by targeted disruption. Male mutant mice had cardiac hypertrophy, but not females.

[55606] It is appreciated that the abovementioned animal model for FKBP1B is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[55607] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [55608] Arakawa, H.; Nagase, H.; Hayashi, N.; Fujiwara, T.; Ogawa, M.; Shin, S.; Nakamura, Y. : Molecular cloning and expression of a novel human gene that is highly homologous to human FK506-binding protein 12kDa (hFKBP-12) and characterization of two alternatively spliced transcripts. Biochem. Biophys. Res. Commun. 200: 836-843, 1994. ; and

- [55610] Further studies establishing the function and utilities of FKBP1B are found in John Hopkins OMIM database record ID 600620, and in cited publications numbered 6560-6561 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Homeo Box B6 (HOXB6, Accession XM\_008560) is another VGAM1644 host target gene. HOXB6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HOXB6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HOXB6 BINDING SITE, designated SEQ ID:30088, to the nucleotide sequence of VGAM1644 RNA, herein designated VGAM RNA, also designated SEQ ID:4355.

[55611] Another function of VGAM1644 is therefore inhibition of Homeo Box B6 (HOXB6, Accession XM\_008560), a gene which participates in establishing segmentation patterns and in determining segment identities. Accordingly, utilities of VGAM1644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXB6. The function of HOXB6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1355. Kinesin Family Member 5C (KIF5C, Accession NM\_004522) is another VGAM1644 host target gene. KIF5C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIF5C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIF5C BINDING SITE, designated SEQ ID:10858, to the nucleotide sequence of VGAM1644 RNA,

herein designated VGAM RNA, also designated SEQ ID:4355.

[55612] Another function of VGAM1644 is therefore inhibition of Kinesin Family Member 5C (KIF5C, Accession NM\_004522). Accordingly, utilities of VGAM1644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIF5C. Leucine Zipper Transcription Factor-like 1 (LZTFL1, Accession NM\_020347) is another VGAM1644 host target gene. LZTFL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LZTFL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LZTFL1 BINDING SITE, designated SEQ ID:21599, to the nucleotide sequence of VGAM1644 RNA, herein designated VGAM RNA, also designated SEQ ID:4355.

[55613] Another function of VGAM1644 is therefore inhibition of Leucine Zipper Transcription Factor-like 1 (LZTFL1, Accession NM\_020347). Accordingly, utilities of VGAM1644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LZTFL1. Phosphatidylinositol Glycan, Class A (paroxysmal nocturnal

hemoglobinuria) (PIGA, Accession NM\_020472) is another VGAM1644 host target gene. PIGA BINDING SITE1 through PIGA BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PIGA, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIGA BINDING SITE1 through PIGA BINDING SITE3, designated SEQ ID:21713, SEQ ID:21720 and SEQ ID:8500 respectively, to the nucleotide sequence of VGAM1644 RNA, herein designated VGAM RNA, also designated SEQ ID:4355.

[55614] Another function of VGAM1644 is therefore inhibition of Phosphatidylinositol Glycan, Class A (paroxysmal nocturnal hemoglobinuria) (PIGA, Accession NM\_020472). Accordingly, utilities of VGAM1644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIGA. Syntaxin Binding Protein 1 (STXBP1, Accession NM\_003165) is another VGAM1644 host target gene. STXBP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STXBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of STXBP1 BINDING SITE, designated SEQ ID:9143, to the nucleotide sequence of VGAM1644 RNA, herein designated VGAM RNA, also designated SEQ ID:4355.

[55615] Another function of VGAM1644 is therefore inhibition of Syntaxin Binding Protein 1 (STXBP1, Accession NM\_003165), a gene which may play a role in determining the specificity of intracellular fusion reactions. Accordingly, utilities of VGAM1644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STXBP1. The function of STXBP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM708. Transcription Factor Binding to IGHM Enhancer 3 (TFE3, Accession NM\_006521) is another VGAM1644 host target gene. TFE3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TFE3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TFE3 BINDING SITE, designated SEQ ID:13277, to the nucleotide

sequence of VGAM1644 RNA, herein designated VGAM RNA, also designated SEQ ID:4355.

[55616] Another function of VGAM1644 is therefore inhibition of Transcription Factor Binding to IGHM Enhancer 3 (TFE3, Accession NM\_006521), a gene which is a positive-acting transcription factor that binds to the immunoglobulin enhancer mue3 motif. Accordingly, utilities of VGAM1644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TFE3. The function of TFE3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM443. Kell Blood Group Precursor (McLeod phenotype) (XK, Accession NM\_021083) is another VGAM1644 host target gene. XK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by XK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of XK BINDING SITE, designated SEQ ID:22058, to the nucleotide sequence of VGAM1644 RNA, herein designated VGAM RNA, also designated SEQ ID:4355.

[55617] Another function of VGAM1644 is therefore inhibition of

Kell Blood Group Precursor (McLeod phenotype) (XK, Accession NM\_021083). Accordingly, utilities of VGAM1644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XK. Apolipoprotein A-V (APOA5, Accession NM\_052968) is another VGAM1644 host target gene. APOA5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by APOA5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APOA5 BINDING SITE, designated SEQ ID:27539, to the nucleotide sequence of VGAM1644 RNA, herein designated VGAM RNA, also designated SEQ ID:4355.

[55618] Another function of VGAM1644 is therefore inhibition of Apolipoprotein A-V (APOA5, Accession NM\_052968). Accordingly, utilities of VGAM1644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APOA5. BANP (Accession XM\_038696) is another VGAM1644 host target gene. BANP BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by BANP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BANP BINDING SITE, designated SEQ ID:32913, to the nucleotide sequence of VGAM1644 RNA, herein designated VGAM RNA, also designated SEQ ID:4355.

[55619] Another function of VGAM1644 is therefore inhibition of BANP (Accession XM\_038696). Accordingly, utilities of VGAM1644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BANP. CD109 (Accession NM\_133493) is another VGAM1644 host target gene. CD109 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CD109, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CD109 BINDING SITE, designated SEQ ID:28573, to the nucleotide sequence of VGAM1644 RNA, herein designated VGAM RNA, also designated SEQ ID:4355.

[55620] Another function of VGAM1644 is therefore inhibition of CD109 (Accession NM\_133493). Accordingly, utilities of VGAM1644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD109.

Cleavage and Polyadenylation Specific Factor 2, 100kDa (CPSF2, Accession XM\_029311) is another VGAM1644 host target gene. CPSF2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CPSF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CPSF2 BINDING SITE, designated SEQ ID:30866, to the nucleotide sequence of VGAM1644 RNA, herein designated VGAM RNA, also designated SEQ ID:4355.

[55621] Another function of VGAM1644 is therefore inhibition of Cleavage and Polyadenylation Specific Factor 2, 100kDa (CPSF2, Accession XM\_029311). Accordingly, utilities of VGAM1644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPSF2. FLJ12057 (Accession NM\_024768) is another VGAM1644 host target gene. FLJ12057 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12057, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12057 BINDING SITE,

designated SEQ ID:24126, to the nucleotide sequence of VGAM1644 RNA, herein designated VGAM RNA, also designated SEQ ID:4355.

[55622] Another function of VGAM1644 is therefore inhibition of FLJ12057 (Accession NM\_024768). Accordingly, utilities of VGAM1644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12057. FLJ20203 (Accession NM\_017710) is another VGAM1644 host target gene. FLJ20203 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20203, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20203 BINDING SITE, designated SEQ ID:19291, to the nucleotide sequence of VGAM1644 RNA, herein designated VGAM RNA, also designated SEQ ID:4355.

[55623] Another function of VGAM1644 is therefore inhibition of FLJ20203 (Accession NM\_017710). Accordingly, utilities of VGAM1644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20203. FLJ20508 (Accession NM\_017850) is another VGAM1644 host target gene. FLJ20508 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20508, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20508 BINDING SITE, designated SEQ ID:19518, to the nucleotide sequence of VGAM1644 RNA, herein designated VGAM RNA, also designated SEQ ID:4355.

[55624] Another function of VGAM1644 is therefore inhibition of FLJ20508 (Accession NM\_017850). Accordingly, utilities of VGAM1644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20508. FLJ21140 (Accession NM\_024776) is another VGAM1644 host target gene. FLJ21140 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21140, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21140 BINDING SITE, designated SEQ ID:24142, to the nucleotide sequence of VGAM1644 RNA, herein designated VGAM RNA, also designated SEQ ID:4355.

[55625] Another function of VGAM1644 is therefore inhibition of

FLJ21140 (Accession NM\_024776). Accordingly, utilities of VGAM1644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21140. FLJ21459 (Accession NM\_024521) is another VGAM1644 host target gene. FLJ21459 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21459, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21459 BINDING SITE, designated SEQ ID:23719, to the nucleotide sequence of VGAM1644 RNA, herein designated VGAM RNA, also designated SEQ ID:4355.

[55626] Another function of VGAM1644 is therefore inhibition of FLJ21459 (Accession NM\_024521). Accordingly, utilities of VGAM1644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21459. Gamma-aminobutyric Acid (GABA) B Receptor, 1 (GABBR1, Accession NM\_001470) is another VGAM1644 host target gene. GABBR1 BINDING SITE1 and GABBR1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GABBR1, corresponding to HOST TARGET binding sites such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GABBR1 BINDING SITE1 and GABBR1 BINDING SITE2, designated SEQ ID:7206 and SEQ ID:22423 respectively, to the nucleotide sequence of VGAM1644 RNA, herein designated VGAM RNA, also designated SEQ ID:4355.

[55627] Another function of VGAM1644 is therefore inhibition of Gamma-aminobutyric Acid (GABA) B Receptor, 1 (GABBR1, Accession NM\_001470). Accordingly, utilities of VGAM1644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GABBR1. KIAA1023 (Accession NM\_017604) is another VGAM1644 host target gene. KIAA1023 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1023, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1023 BINDING SITE, designated SEQ ID:19093, to the nucleotide sequence of VGAM1644 RNA, herein designated VGAM RNA, also designated SEQ ID:4355.

[55628] Another function of VGAM1644 is therefore inhibition of KIAA1023 (Accession NM\_017604). Accordingly, utilities

of VGAM1644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1023. KIAA1317 (Accession XM\_098368) is another VGAM1644 host target gene. KIAA1317 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1317, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1317 BINDING SITE, designated SEQ ID:41632, to the nucleotide sequence of VGAM1644 RNA, herein designated VGAM RNA, also designated SEQ ID:4355.

[55629] Another function of VGAM1644 is therefore inhibition of KIAA1317 (Accession XM\_098368). Accordingly, utilities of VGAM1644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1317. KIAA1617 (Accession XM\_166140) is another VGAM1644 host target gene. KIAA1617 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1617, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1617 BINDING SITE, designated SEQ ID:43942, to the nucleotide sequence of VGAM1644 RNA, herein designated VGAM RNA, also designated SEQ ID:4355.

[55630] Another function of VGAM1644 is therefore inhibition of KIAA1617 (Accession XM\_166140). Accordingly, utilities of VGAM1644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1617. MGC10966 (Accession NM\_031471) is another VGAM1644 host target gene. MGC10966 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC10966, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC10966 BINDING SITE, designated SEQ ID:25538, to the nucleotide sequence of VGAM1644 RNA, herein designated VGAM RNA, also designated SEQ ID:4355.

[55631] Another function of VGAM1644 is therefore inhibition of MGC10966 (Accession NM\_031471). Accordingly, utilities of VGAM1644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10966. Nuclear Receptor Subfamily 6, Group A, Member 1 (NR6A1, Accession NM\_033335) is another

VGAM1644 host target gene. NR6A1 BINDING SITE1 through NR6A1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by NR6A1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NR6A1 BINDING SITE1 through NR6A1 BINDING SITE3, designated SEQ ID:27189, SEQ ID:27183 and SEQ ID:7235 respectively, to the nucleotide sequence of VGAM1644 RNA, herein designated VGAM RNA, also designated SEQ ID:4355.

[55632] Another function of VGAM1644 is therefore inhibition of Nuclear Receptor Subfamily 6, Group A, Member 1 (NR6A1, Accession NM\_033335). Accordingly, utilities of VGAM1644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NR6A1. PME-1 (Accession NM\_016147) is another VGAM1644 host target gene. PME-1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PME-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PME-1 BINDING SITE, des-

ignated SEQ ID:18231, to the nucleotide sequence of VGAM1644 RNA, herein designated VGAM RNA, also designated SEQ ID:4355.

[55633] Another function of VGAM1644 is therefore inhibition of PME-1 (Accession NM\_016147). Accordingly, utilities of VGAM1644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PME-1. Solute Carrier Family 38, Member 4 (SLC38A4, Accession NM\_018018) is another VGAM1644 host target gene. SLC38A4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC38A4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC38A4 BINDING SITE, designated SEQ ID:19759, to the nucleotide sequence of VGAM1644 RNA, herein designated VGAM RNA, also designated SEQ ID:4355.

[55634] Another function of VGAM1644 is therefore inhibition of Solute Carrier Family 38, Member 4 (SLC38A4, Accession NM\_018018). Accordingly, utilities of VGAM1644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC38A4. LOC145739

(Accession XM\_085222) is another VGAM1644 host target gene. LOC145739 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145739, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145739 BINDING SITE, designated SEQ ID:37961, to the nucleotide sequence of VGAM1644 RNA, herein designated VGAM RNA, also designated SEQ ID:4355.

[55635] Another function of VGAM1644 is therefore inhibition of LOC145739 (Accession XM\_085222). Accordingly, utilities of VGAM1644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145739. LOC147180 (Accession XM\_097207) is another VGAM1644 host target gene. LOC147180 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147180, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147180 BINDING SITE, designated SEQ ID:40818, to the nucleotide sequence of VGAM1644 RNA, herein design-

nated VGAM RNA, also designated SEQ ID:4355.

[55636] Another function of VGAM1644 is therefore inhibition of LOC147180 (Accession XM\_097207). Accordingly, utilities of VGAM1644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147180. LOC148293 (Accession XM\_086138) is another VGAM1644 host target gene. LOC148293 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148293, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148293 BINDING SITE, designated SEQ ID:38519, to the nucleotide sequence of VGAM1644 RNA, herein designated VGAM RNA, also designated SEQ ID:4355.

[55637] Another function of VGAM1644 is therefore inhibition of LOC148293 (Accession XM\_086138). Accordingly, utilities of VGAM1644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148293. LOC149535 (Accession XM\_086567) is another VGAM1644 host target gene. LOC149535 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149535, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149535 BINDING SITE, designated SEQ ID:38772, to the nucleotide sequence of VGAM1644 RNA, herein designated VGAM RNA, also designated SEQ ID:4355.

[55638] Another function of VGAM1644 is therefore inhibition of LOC149535 (Accession XM\_086567). Accordingly, utilities of VGAM1644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149535. LOC150343 (Accession XM\_086823) is another VGAM1644 host target gene. LOC150343 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150343, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150343 BINDING SITE, designated SEQ ID:38903, to the nucleotide sequence of VGAM1644 RNA, herein designated VGAM RNA, also designated SEQ ID:4355.

[55639] Another function of VGAM1644 is therefore inhibition of LOC150343 (Accession XM\_086823). Accordingly, utilities of VGAM1644 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC150343. LOC152048 (Accession XM\_098158) is another VGAM1644 host target gene. LOC152048 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC152048, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152048 BINDING SITE, designated SEQ ID:41426, to the nucleotide sequence of VGAM1644 RNA, herein designated VGAM RNA, also designated SEQ ID:4355.

[55640] Another function of VGAM1644 is therefore inhibition of LOC152048 (Accession XM\_098158). Accordingly, utilities of VGAM1644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152048. LOC155179 (Accession XM\_088169) is another VGAM1644 host target gene. LOC155179 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC155179, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155179 BINDING SITE, designated SEQ ID:39559, to

the nucleotide sequence of VGAM1644 RNA, herein designated VGAM RNA, also designated SEQ ID:4355.

[55641] Another function of VGAM1644 is therefore inhibition of LOC155179 (Accession XM\_088169). Accordingly, utilities of VGAM1644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155179. LOC221466 (Accession XM\_168087) is another VGAM1644 host target gene. LOC221466 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221466, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221466 BINDING SITE, designated SEQ ID:44994, to the nucleotide sequence of VGAM1644 RNA, herein designated VGAM RNA, also designated SEQ ID:4355.

[55642] Another function of VGAM1644 is therefore inhibition of LOC221466 (Accession XM\_168087). Accordingly, utilities of VGAM1644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221466. LOC255779 (Accession XM\_171147) is another VGAM1644 host target gene. LOC255779 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC255779, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255779 BINDING SITE, designated SEQ ID:45943, to the nucleotide sequence of VGAM1644 RNA, herein designated VGAM RNA, also designated SEQ ID:4355.

[55643] Another function of VGAM1644 is therefore inhibition of LOC255779 (Accession XM\_171147). Accordingly, utilities of VGAM1644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255779. LOC90049 (Accession XM\_028387) is another VGAM1644 host target gene. LOC90049 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90049, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90049 BINDING SITE, designated SEQ ID:30698, to the nucleotide sequence of VGAM1644 RNA, herein designated VGAM RNA, also designated SEQ ID:4355.

[55644] Another function of VGAM1644 is therefore inhibition of LOC90049 (Accession XM\_028387). Accordingly, utilities

of VGAM1644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90049. LOC91252 (Accession XM\_037173) is another VGAM1644 host target gene. LOC91252 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91252, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91252 BINDING SITE, designated SEQ ID:32553, to the nucleotide sequence of VGAM1644 RNA, herein designated VGAM RNA, also designated SEQ ID:4355.

[55645] Another function of VGAM1644 is therefore inhibition of LOC91252 (Accession XM\_037173). Accordingly, utilities of VGAM1644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91252. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1645 (VGAM1645) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[55646] VGAM1645 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1645 was detected is described hereinabove with reference to Figs. 1–8.

[55647] VGAM1645 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Dengue Virus. VGAM1645 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[55648] VGAM1645 gene encodes a VGAM1645 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1645 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1645 precursor RNA is designated SEQ ID:1631, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1631 is located at position 5184 relative to the genome of Dengue Virus.

[55649] VGAM1645 precursor RNA folds onto itself, forming VGAM1645 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[55650] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1645 folded precursor RNA into VGAM1645 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1645 RNA is designated SEQ ID:4356, and is provided hereinbelow with reference to the sequence listing part.

[55651] VGAM1645 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1645 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1645 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[55652] VGAM1645 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1645 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1645 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1645 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1645 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[55653] The complementary binding of VGAM1645 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1645 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1645 host target RNA into VGAM1645 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[55654] It is appreciated that VGAM1645 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1645 host target genes. The mRNA of each one of this plurality of VGAM1645 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1645 RNA, herein designated VGAM RNA, and which when bound by VGAM1645 RNA causes inhibition of translation of respective one or more VGAM1645 host target proteins.

[55655] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1645 gene, herein designated VGAM GENE, on one or more VGAM1645 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[55656] It is yet further appreciated that a function of VGAM1645 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1645 include diagnosis, prevention and treatment of viral infection by Dengue Virus. Specific functions, and accordingly utilities, of VGAM1645 correlate with, and may be deduced from, the identity of the host target genes which VGAM1645 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[55657] Nucleotide sequences of the VGAM1645 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the  
`diced` VGAM1645 RNA, herein designated VGAM RNA,  
and a schematic representation of the secondary folding  
of VGAM1645 folded precursor RNA, herein designated  
VGAM FOLDED PRECURSOR RNA, of VGAM1645 are further  
described hereinbelow with reference to Table 1.

[55658] Nucleotide sequences of host target binding sites, such as  
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of  
Fig. 1, found on VGAM1645 host target RNA, and  
schematic representation of the complementarity of each  
of these host target binding sites to VGAM1645 RNA,  
herein designated VGAM RNA, are described hereinbelow  
with reference to Table 2.

[55659] As mentioned hereinabove with reference to Fig. 1, a  
function of VGAM1645 gene, herein designated VGAM is  
inhibition of expression of VGAM1645 target genes. It is  
appreciated that specific functions, and accordingly utili-  
ties, of VGAM1645 correlate with, and may be deduced  
from, the identity of the target genes which VGAM1645  
binds and inhibits, and the function of these target genes,  
as elaborated hereinbelow.

[55660] Collagen, Type IV, Alpha 1 (COL4A1, Accession  
NM\_001845) is a VGAM1645 host target gene. COL4A1

BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by COL4A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL4A1 BINDING SITE, designated SEQ ID:7578, to the nucleotide sequence of VGAM1645 RNA, herein designated VGAM RNA, also designated SEQ ID:4356.

[55661] A function of VGAM1645 is therefore inhibition of Collagen, Type IV, Alpha 1 (COL4A1, Accession NM\_001845), a gene which is a member of a subfamily of collagen extracellular matrix proteins. Accordingly, utilities of VGAM1645 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL4A1. The function of COL4A1 has been established by previous studies. Types I, II, and III collagen, the so-called interstitial collagens, are in many ways distinct from basement membrane collagen. Type IV collagen does not form ordered fibrillar structures; rather, a meshwork is formed by 4 molecules held together at the ends. Both disulfide and typical lysyl-derived collagen crosslinks are involved (Kuhn, 1982). Crouch et al. (1980) presented evidence

that type IV procollagen contains 2 distinct chains. The collagen IV molecule is a heterotrimer of 2 alpha-1 chains and 1 alpha-2 chain (Mayne et al., 1984). There are presumably 2 gene loci responsible for the alpha-1 and alpha-2 chains of type IV collagen. Using a cloned gene as a probe on Southern blots of DNA from a panel of interspecies somatic cell hybrids, Solomon et al. (1985) assigned one of the collagen IV genes, COL4A1, to chromosome 13. Pihlajaniemi et al. (1985) used dual-laser sorted chromosomes and spot-blot analysis to assign genomic DNA sequences coding for COL4A1 to chromosome 13. By in situ hybridization, Boyd et al. (1986) localized the gene to the end of the long arm of chromosome 13. Southern and spot-blot hybridization showed that these genomic sequences were present only once per haploid genome. Emanuel et al. (1986) assigned COL4A1 to the telomeric region of 13q (13q34) by in situ hybridization. Bowcock et al. (1987) found that the COL4A1 locus is linked to D13S3, which in turn has been assigned to 13q33-q34 by in situ hybridization. They found a maximum lod score of 16.5 at  $\theta = 0.01$ . Griffin et al. (1987) showed by in situ hybridization and Southern blot analysis of DNA from somatic cell hybrids that the COL4A2 gene is also on the

distal long arm of chromosome 13, apparently closely linked to the alpha-1(IV) gene. By means of pulsed-field gel electrophoresis (PFGE) and infrequently cutting restriction enzymes, Cutting et al. (1987) showed that the COL4A1 and COL4A2 genes are separated by no more than 400 kb. Using RFLPs identified within the two genes, Hebert et al. (1987) also showed that COL4A1 and COL4A2 are closely linked. Bowcock et al. (1988) found that the COL4A1 and COL4A2 genes are linked, with a maximum likelihood estimate of recombination of 0.028 at a lod score of 19.98. This and the lack of linkage disequilibrium are inconsistent with relatively high recombination between the 2 loci--higher than expected for 2 genes that lie within 650 kb of each other. Koizumi et al. (1995) used interspecific and intersubspecific mapping panels to locate the Col4a1 gene to the centromeric region of mouse chromosome 8. COL4A2 (OMIM Ref. No. 120090) and coagulation factor X (F10; 227600) mapped to the same region, thus defining a new region of homology of synteny between mouse chromosome 8 and human chromosome 13 Goodpasture syndrome (glomerulonephritis and pulmonary hemorrhage). Butkowski et al. (1987) localized the Goodpasture epitope

to a novel chain of type IV collagen composed of 3 distinctive subunits--M1, M2\*, and M3. The Goodpasture epitope was found to be situated exclusively on M2\*.

Turner et al. (1992) demonstrated that the Goodpasture antigen is the alpha-3 chain of type IV collagen (COL4A3; 120070

[55662] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Chem. 260: 7681-7687, 1985. ; and

[55664] Turner, N.; Mason, P. J.; Brown, R.; Fox, M.; Povey, S.; Rees, A.; Pusey, C. D. : Molecular cloning of the human Goodpasture antigen demonstrates it to be the alpha-3 chain of type IV c.

[55665] Further studies establishing the function and utilities of COL4A1 are found in John Hopkins OMIM database record ID 120130, and in cited publications numbered 266-270, 346-274, 4586, 3621-282, 383, 40 and 8951-406 listed

in the bibliography section hereinbelow, which are also hereby incorporated by reference. Follistatin-like 1 (FSTL1, Accession NM\_007085) is another VGAM1645 host target gene. FSTL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FSTL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FSTL1 BINDING SITE, designated SEQ ID:13947, to the nucleotide sequence of VGAM1645 RNA, herein designated VGAM RNA, also designated SEQ ID:4356.

[55666] Another function of VGAM1645 is therefore inhibition of Follistatin-like 1 (FSTL1, Accession NM\_007085), a gene which may modulate the action of some growth factors on cell proliferation and differentiation. Accordingly, utilities of VGAM1645 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FSTL1. The function of FSTL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM791. Membrane Component, Chromosome 11, Surface Marker 1 (M11S1, Accession NM\_005898) is another VGAM1645 host target gene. M11S1 BINDING SITE

is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by M11S1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of M11S1 BINDING SITE, designated SEQ ID:12518, to the nucleotide sequence of VGAM1645 RNA, herein designated VGAM RNA, also designated SEQ ID:4356.

[55667] Another function of VGAM1645 is therefore inhibition of Membrane Component, Chromosome 11, Surface Marker 1 (M11S1, Accession NM\_005898), a gene which may play a role in transporting nutrients from the gut lumen across the gutlining epithelial cell layer. Accordingly, utilities of VGAM1645 include diagnosis, prevention and treatment of diseases and clinical conditions associated with M11S1. The function of M11S1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM131. Zinc Finger Protein 124 (HZF-16) (ZNF124, Accession NM\_003431) is another VGAM1645 host target gene. ZNF124 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ZNF124, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF124 BINDING SITE, designated SEQ ID:9481, to the nucleotide sequence of VGAM1645 RNA, herein designated VGAM RNA, also designated SEQ ID:4356.

[55668] Another function of VGAM1645 is therefore inhibition of Zinc Finger Protein 124 (HZF-16) (ZNF124, Accession NM\_003431). Accordingly, utilities of VGAM1645 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF124. DKFZP434O047 (Accession NM\_015594) is another VGAM1645 host target gene. DKFZP434O047 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZP434O047, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434O047 BINDING SITE, designated SEQ ID:17865, to the nucleotide sequence of VGAM1645 RNA, herein designated VGAM RNA, also designated SEQ ID:4356.

[55669] Another function of VGAM1645 is therefore inhibition of DKFZP434O047 (Accession NM\_015594). Accordingly,

utilities of VGAM1645 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434O047. FXYD Domain Containing Ion Transport Regulator 3 (FXYD3, Accession NM\_021910) is another VGAM1645 host target gene. FXYD3 BINDING SITE1 and FXYD3 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FXYD3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FXYD3 BINDING SITE1 and FXYD3 BINDING SITE2, designated SEQ ID:22435 and SEQ ID:12592 respectively, to the nucleotide sequence of VGAM1645 RNA, herein designated VGAM RNA, also designated SEQ ID:4356.

[55670] Another function of VGAM1645 is therefore inhibition of FXYD Domain Containing Ion Transport Regulator 3 (FXYD3, Accession NM\_021910). Accordingly, utilities of VGAM1645 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FXYD3. RNA Binding Motif Protein 11 (RBM11, Accession NM\_144770) is another VGAM1645 host target gene. RBM11 BINDING SITE is HOST TARGET binding site found

in the 3` untranslated region of mRNA encoded by RBM11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RBM11 BINDING SITE, designated SEQ ID:29560, to the nucleotide sequence of VGAM1645 RNA, herein designated VGAM RNA, also designated SEQ ID:4356.

[55671] Another function of VGAM1645 is therefore inhibition of RNA Binding Motif Protein 11 (RBM11, Accession NM\_144770). Accordingly, utilities of VGAM1645 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RBM11. LOC203292 (Accession XM\_117527) is another VGAM1645 host target gene. LOC203292 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC203292, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203292 BINDING SITE, designated SEQ ID:43500, to the nucleotide sequence of VGAM1645 RNA, herein designated VGAM RNA, also designated SEQ ID:4356.

[55672] Another function of VGAM1645 is therefore inhibition of LOC203292 (Accession XM\_117527). Accordingly, utilities of VGAM1645 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203292. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1646 (VGAM1646) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[55673] VGAM1646 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1646 was detected is described hereinabove with reference to Figs. 1–8.

[55674] VGAM1646 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Dengue Virus. VGAM1646 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[55675] VGAM1646 gene encodes a VGAM1646 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM1646 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1646 precursor RNA is designated SEQ ID:1632, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1632 is located at position 9914 relative to the genome of Dengue Virus.

- [55676] VGAM1646 precursor RNA folds onto itself, forming VGAM1646 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [55677] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1646 folded precursor RNA into VGAM1646 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 75%) nucleotide sequence of VGAM1646 RNA is designated SEQ ID:4357, and is provided hereinbelow with reference to the sequence listing part.

[55678] VGAM1646 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1646 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1646 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[55679] VGAM1646 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1646 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1646 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1646 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1646 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[55680] The complementary binding of VGAM1646 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1646 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1646 host target RNA into VGAM1646 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[55681] It is appreciated that VGAM1646 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1646 host target genes. The mRNA of each one of this plurality of VGAM1646 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1646 RNA, herein designated VGAM RNA, and which when bound by VGAM1646 RNA causes inhibition of translation of respective one or more VGAM1646 host target proteins.

[55682] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1646 gene, herein designated VGAM GENE, on one or more VGAM1646 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[55683] It is yet further appreciated that a function of VGAM1646 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1646 include diagnosis, prevention and treatment of viral infection by Dengue Virus. Specific functions, and accordingly utilities, of VGAM1646 correlate with, and may be deduced from, the identity of the host target genes which VGAM1646 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[55684] Nucleotide sequences of the VGAM1646 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1646 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1646 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1646 are further described hereinbelow with reference to Table 1.

[55685] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1646 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1646 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[55686] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1646 gene, herein designated VGAM is inhibition of expression of VGAM1646 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1646 correlate with, and may be deduced from, the identity of the target genes which VGAM1646 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[55687] WW45 (Accession NM\_021818) is a VGAM1646 host target gene. WW45 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by WW45, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WW45 BINDING SITE, designated SEQ ID:22396, to the nucleotide sequence of VGAM1646 RNA, herein designated VGAM RNA, also designated SEQ ID:4357.

[55688] A function of VGAM1646 is therefore inhibition of WW45 (Accession NM\_021818), a gene which is required for ubiquitination and therefore degradation of several cell surface proteins like gap1, fur4, mal61 and ste2. also acts

on rbp1. Accordingly, utilities of VGAM1646 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WW45. The function of WW45 has been established by previous studies. By searching an EST database using *C. elegans* and *Drosophila* WW domain-containing protein sequences as bait, followed by 5-prime and 3-prime RACE using a human heart cDNA library, Valverde (2000) obtained a full-length cDNA encoding WW45. The deduced 383-amino acid protein has a predicted molecular mass of approximately 45 kD. It contains 2 WW domains, a region rich in prolines and glutamines, and a coiled-coil region, as well as a nuclear localization signal and 2 endoplasmic reticulum retention signals. The mouse Ww45 cDNA has a different 3-prime untranslated region and encodes a protein that shares 93% identity with human WW45. Northern blot and RT-PCR analyses demonstrated that both human and mouse WW45 transcripts (1.2 and 2.7 kb, respectively) are ubiquitously expressed in adult tissues. In human, highest expression was in pancreas, while in mouse, highest expression was in testis. Northern blot analysis of whole mouse embryos showed that embryonic expression of Ww45 first occurred at 7 days postcoitum. Expression levels markedly

decreased at day 11 and remained low at days 15 and 17, suggesting that WW45 expression is developmentally regulated. Accordingly, expression of human WW45 was found to be higher in fetal heart than in adult heart. By radiation hybrid analysis, Valverde (2000) mapped the WW45 gene to chromosome 14q13–q23. In a screen for *Drosophila* mutations that result in tissue overgrowth, Tapon et al. (2002) identified salvador (sav), a gene that promotes both cell cycle exit and cell death. Elevated cyclin E (OMIM Ref. No. 123837) and inhibitor of apoptosis-1 (Diap1) levels were found in mutant cells, resulting in delayed cell cycle exit and impaired apoptosis. Salvador contains 2 WW domains and binds to the Warts (or OMIM Ref. No. 603473) protein kinase. Because WW45 is the human ortholog of salvador, Tapon et al. (2002) sequenced the entire WW45 coding region in a panel of 52 tumor-derived cell lines, representing a broad range of tissue types. One colon cancer cell line, HCT15, had a heterozygous C-to-A mutation at nucleotide 554, resulting in an asp185-to-ala substitution. This mutation was not present in 185 population-based controls (370 chromosomes), indicating that it is not a common polymorphism. The authors noted that HCT15 carries a mutation in the

mismatch repair gene MSH6 (OMIM Ref. No. 600678), which appears to enhance the frequency of point mutations in other genes. Two renal cancer cell lines, ACHN and 786-O, had deletions involving WW45. The normal allele was not present in either cell line, indicating that these cell lines were either homozygous or hemizygous for the deletion. The WW45 transcript was undetectable by RT-PCR in both cell lines, and a Southern blot using a probe derived from the 3-prime portion of the gene demonstrated that this part of the gene was absent in both cell lines. In cell line 786-O, PCR analysis of genomic DNA indicated that there was a deletion of approximately 157 kb, with the 5-prime breakpoint between exons 2 and 3 of WW45. The deletion in ACHN of approximately 138 kb encompassed the entire gene. The common region of overlap between these 2 deletions was only 21 kb, containing exons 3 to 5 of WW45. No other transcription units were identified within this 21 kb interval.

[55689] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

promotes both cell cycle exit and apoptosis in *Drosophila* and is mutated in human cancer cell lines. *Cell* 110: 467–478, 2002. ; and

- [55691] Valverde, P. : Cloning, expression, and mapping of hWW45, a novel human WW domain-containing gene. *Biochem. Biophys. Res. Commun.* 276: 990–998, 2000.
- [55692] Further studies establishing the function and utilities of WW45 are found in John Hopkins OMIM database record ID 607203, and in cited publications numbered 5562–5563 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. KIAA1034 (Accession XM\_031223) is another VGAM1646 host target gene. KIAA1034 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1034, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1034 BINDING SITE, designated SEQ ID:31310, to the nucleotide sequence of VGAM1646 RNA, herein designated VGAM RNA, also designated SEQ ID:4357.
- [55693] Another function of VGAM1646 is therefore inhibition of KIAA1034 (Accession XM\_031223). Accordingly, utilities

of VGAM1646 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1034. SV2B (Accession NM\_014848) is another VGAM1646 host target gene. SV2B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SV2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SV2B BINDING SITE, designated SEQ ID:16882, to the nucleotide sequence of VGAM1646 RNA, herein designated VGAM RNA, also designated SEQ ID:4357.

[55694] Another function of VGAM1646 is therefore inhibition of SV2B (Accession NM\_014848). Accordingly, utilities of VGAM1646 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SV2B. LOC219738 (Accession NM\_145306) is another VGAM1646 host target gene. LOC219738 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219738, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC219738 BINDING SITE, designated SEQ ID:29818, to the nucleotide sequence of VGAM1646 RNA, herein designated VGAM RNA, also designated SEQ ID:4357.

[55695] Another function of VGAM1646 is therefore inhibition of LOC219738 (Accession NM\_145306). Accordingly, utilities of VGAM1646 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219738. LOC220573 (Accession XM\_045569) is another VGAM1646 host target gene. LOC220573 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220573, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220573 BINDING SITE, designated SEQ ID:34482, to the nucleotide sequence of VGAM1646 RNA, herein designated VGAM RNA, also designated SEQ ID:4357.

[55696] Another function of VGAM1646 is therefore inhibition of LOC220573 (Accession XM\_045569). Accordingly, utilities of VGAM1646 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220573. LOC91960 (Accession XM\_041872) is another VGAM1646 host target gene. LOC91960 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91960, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91960 BINDING SITE, designated SEQ ID:33611, to the nucleotide sequence of VGAM1646 RNA, herein designated VGAM RNA, also designated SEQ ID:4357.

[55697] Another function of VGAM1646 is therefore inhibition of LOC91960 (Accession XM\_041872). Accordingly, utilities of VGAM1646 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91960. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1647 (VGAM1647) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[55698] VGAM1647 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1647 was detected is described hereinabove with reference to Figs. 1–8.

[55699] VGAM1647 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 8. VGAM1647 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[55700] VGAM1647 gene encodes a VGAM1647 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1647 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1647 precursor RNA is designated SEQ ID:1633, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1633 is located at position 104577 relative to the genome of Human Herpesvirus 8.

[55701] VGAM1647 precursor RNA folds onto itself, forming VGAM1647 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[55702] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1647 folded precursor RNA into VGAM1647 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1647 RNA is designated SEQ ID:4358, and is provided hereinbelow with reference to the sequence listing part.

[55703] VGAM1647 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1647 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1647 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[55704] VGAM1647 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1647 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1647 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1647 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1647 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[55705] The complementary binding of VGAM1647 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1647 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1647 host target RNA into VGAM1647 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[55706] It is appreciated that VGAM1647 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1647 host target genes. The mRNA of each one of this plurality of VGAM1647 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1647 RNA, herein designated VGAM RNA, and which when bound by VGAM1647 RNA causes inhibition of translation of respective one or more VGAM1647 host target proteins.

[55707] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1647 gene, herein designated VGAM GENE, on one or more VGAM1647 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[55708] It is yet further appreciated that a function of VGAM1647 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1647 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 8. Specific functions, and accordingly utilities, of VGAM1647 correlate with, and may be deduced from, the identity of the host target genes which VGAM1647 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[55709] Nucleotide sequences of the VGAM1647 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1647 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1647 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1647 are further described hereinbelow with reference to Table 1.

[55710] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1647 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1647 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[55711] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1647 gene, herein designated VGAM is inhibition of expression of VGAM1647 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1647 correlate with, and may be deduced from, the identity of the target genes which VGAM1647 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[55712] Calpain 1, (mu/I) Large Subunit (CAPN1, Accession NM\_005186) is a VGAM1647 host target gene. CAPN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAPN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of CAPN1 BINDING SITE, designated SEQ ID:11686, to the nucleotide sequence of VGAM1647 RNA, herein designated VGAM RNA, also designated SEQ ID:4358.

[55713] A function of VGAM1647 is therefore inhibition of Calpain 1, ( $\mu$ /I) Large Subunit (CAPN1, Accession NM\_005186), a gene which is an intracellular protease that requires calcium for its catalytic activity. Accordingly, utilities of VGAM1647 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPN1. The function of CAPN1 has been established by previous studies. Calpain (calcium-dependent protease; EC 3.4.22.17) is an intracellular protease that requires calcium for its catalytic activity. Two isozymes (CANP1 and CANP2), with different calcium requirements, have been identified. Both are heterodimers composed of L (large, catalytic, 80 kD) and S (small, regulatory, 30 kD) subunits. The isozymes share an identical S subunit (OMIM Ref. No. 114170); differences arise from the L subunits (L1 and L2). Using cDNA clones as probes, Ohno et al. (1989, 1990) mapped the CANPL1 and CANPL2 genes as well as the CANPS gene and a gene for another protein, L3, that is homologous to the other 2 L subunits; they used a combi-

nation of spot blot hybridization with sorted chromosomes and Southern hybridization with human-mouse cell hybrid DNAs. In this way they were able to assign CANPL1 to chromosome 11; CANPL2 to chromosome 1; CANPL3 to chromosome 15; and CANPS to chromosome 19.

Courseaux et al. (1996) used a combination of methods to refine maps of the approximately 5-Mb region of 11q13 that includes MEN1 (OMIM Ref. No. 131100). They proposed the following gene order: cen-

-

PGA-

-

FTH1--UGB--AHNAK--ROM1--MDU1--CHRM1--COX8--  
EMK1--FKBP2--PLCB3--[PYGM,  
ZFM1]--FAU--CAPN1--[MLK3,  
RELA]--FOSL1--SEA--CFL1--tel.

[55714] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[55715] Ohno, S.; Minoshima, S.; Kudoh, J.; Fukuyama, R.; Shimizu, Y.; Ohmi-Imajoh, S.; Shimizu, N.; Suzuki, K. : Four genes for the calpain family locate on four distinct human chromosomes. Cytogenet. Cell Genet. 53: 225-229, 1990. ;

and

[55716] Courseaux, A.; Grosgeorge, J.; Gaudray, P.; Pannett, A. A. J.; Forbes, S. A.; Williamson, C.; Bassett, D.; Thakker, R. V.; Teh, B. T.; Farnebo, F.; Shepherd, J.; Skogseid, B.; Larsson, C.

[55717] Further studies establishing the function and utilities of CAPN1 are found in John Hopkins OMIM database record ID 114220, and in cited publications numbered 398 and 12571–12572 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. KIAA0329 (Accession NM\_014844) is another VGAM1647 host target gene. KIAA0329 BINDING SITE1 and KIAA0329 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA0329, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0329 BINDING SITE1 and KIAA0329 BINDING SITE2, designated SEQ ID:16873 and SEQ ID:16874 respectively, to the nucleotide sequence of VGAM1647 RNA, herein designated VGAM RNA, also designated SEQ ID:4358.

[55718] Another function of VGAM1647 is therefore inhibition of

KIAA0329 (Accession NM\_014844). Accordingly, utilities of VGAM1647 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0329. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1648 (VGAM1648) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[55719] VGAM1648 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1648 was detected is described hereinabove with reference to Figs. 1-8.

[55720] VGAM1648 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 8. VGAM1648 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[55721] VGAM1648 gene encodes a VGAM1648 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1648 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1648 precursor RNA is designated SEQ ID:1634, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1634 is located at position 111049 relative to the genome of Human Herpesvirus 8.

- [55722] VGAM1648 precursor RNA folds onto itself, forming VGAM1648 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [55723] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1648 folded precursor RNA into VGAM1648 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide se-

quence of VGAM1648 RNA is designated SEQ ID:4359, and is provided hereinbelow with reference to the sequence listing part.

[55724] VGAM1648 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1648 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1648 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[55725] VGAM1648 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1648 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1648 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM1648 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1648 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[55726] The complementary binding of VGAM1648 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1648 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1648 host target RNA into VGAM1648 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[55727] It is appreciated that VGAM1648 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1648 host target genes. The mRNA of each one of this plurality of VGAM1648 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1648 RNA, herein designated VGAM RNA, and which when bound by VGAM1648 RNA causes inhibition of translation of respective one or more VGAM1648 host target proteins.

[55728] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1648 gene, herein designated VGAM GENE, on one or more VGAM1648 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[55729] It is yet further appreciated that a function of VGAM1648

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1648 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 8. Specific functions, and accordingly utilities, of VGAM1648 correlate with, and may be deduced from, the identity of the host target genes which VGAM1648 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[55730] Nucleotide sequences of the VGAM1648 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1648 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1648 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1648 are further described hereinbelow with reference to Table 1.

[55731] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1648 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1648 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[55732] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1648 gene, herein designated VGAM is inhibition of expression of VGAM1648 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1648 correlate with, and may be deduced from, the identity of the target genes which VGAM1648 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[55733] Lactate Dehydrogenase B (LDHB, Accession NM\_002300) is a VGAM1648 host target gene. LDHB BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LDHB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LDHB BINDING SITE, designated SEQ ID:8085, to the nucleotide sequence of VGAM1648 RNA, herein designated VGAM RNA, also designated SEQ ID:4359.

[55734] A function of VGAM1648 is therefore inhibition of Lactate Dehydrogenase B (LDHB, Accession NM\_002300), a gene which causes dehydrogenation of lactate. Accordingly, utilities of VGAM1648 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with LDHB. The function of LDHB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM273. Paired Box Gene 6 (aniridia, keratitis) (PAX6, Accession NM\_000280) is another VGAM1648 host target gene. PAX6 BINDING SITE1 and PAX6 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PAX6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAX6 BINDING SITE1 and PAX6 BINDING SITE2, designated SEQ ID:5826 and SEQ ID:7310 respectively, to the nucleotide sequence of VGAM1648 RNA, herein designated VGAM RNA, also designated SEQ ID:4359.

[55735] Another function of VGAM1648 is therefore inhibition of Paired Box Gene 6 (aniridia, keratitis) (PAX6, Accession NM\_000280), a gene which involves in oculogenesis. Accordingly, utilities of VGAM1648 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAX6. The function of PAX6 and its association with various diseases and clinical conditions, has been established by previous studies, as described here-

in above with reference to VGAM1499.FLJ14594 (Accession NM\_032808) is another VGAM1648 host target gene. FLJ14594 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14594, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14594 BINDING SITE, designated SEQ ID:26567, to the nucleotide sequence of VGAM1648 RNA, herein designated VGAM RNA, also designated SEQ ID:4359.

[55736] Another function of VGAM1648 is therefore inhibition of FLJ14594 (Accession NM\_032808). Accordingly, utilities of VGAM1648 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14594. KIAA1908 (Accession XM\_055834) is another VGAM1648 host target gene. KIAA1908 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1908, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1908 BINDING SITE, designated SEQ ID:36331, to the

nucleotide sequence of VGAM1648 RNA, herein designated VGAM RNA, also designated SEQ ID:4359.

[55737] Another function of VGAM1648 is therefore inhibition of KIAA1908 (Accession XM\_055834). Accordingly, utilities of VGAM1648 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1908. MGC15875 (Accession NM\_032921) is another VGAM1648 host target gene. MGC15875 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC15875, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC15875 BINDING SITE, designated SEQ ID:26747, to the nucleotide sequence of VGAM1648 RNA, herein designated VGAM RNA, also designated SEQ ID:4359.

[55738] Another function of VGAM1648 is therefore inhibition of MGC15875 (Accession NM\_032921). Accordingly, utilities of VGAM1648 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15875. Ras and Rab Interactor 3 (RIN3, Accession NM\_024832) is another VGAM1648 host target gene. RIN3 BINDING SITE is HOST TARGET binding site found in the

3` untranslated region of mRNA encoded by RIN3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RIN3 BINDING SITE, designated SEQ ID:24232, to the nucleotide sequence of VGAM1648 RNA, herein designated VGAM RNA, also designated SEQ ID:4359.

[55739] Another function of VGAM1648 is therefore inhibition of Ras and Rab Interactor 3 (RIN3, Accession NM\_024832). Accordingly, utilities of VGAM1648 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RIN3. UREB1 (Accession NM\_031407) is another VGAM1648 host target gene. UREB1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by UREB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UREB1 BINDING SITE, designated SEQ ID:25365, to the nucleotide sequence of VGAM1648 RNA, herein designated VGAM RNA, also designated SEQ ID:4359.

[55740] Another function of VGAM1648 is therefore inhibition of UREB1 (Accession NM\_031407). Accordingly, utilities of

VGAM1648 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UREB1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1649 (VGAM1649) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[55741] VGAM1649 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1649 was detected is described hereinabove with reference to Figs. 1–8.

[55742] VGAM1649 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 8. VGAM1649 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[55743] VGAM1649 gene encodes a VGAM1649 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1649 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1649 precursor RNA is desig-

nated SEQ ID:1635, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1635 is located at position 105452 relative to the genome of Human Herpesvirus 8.

- [55744] VGAM1649 precursor RNA folds onto itself, forming VGAM1649 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [55745] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1649 folded precursor RNA into VGAM1649 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 60%) nucleotide sequence of VGAM1649 RNA is designated SEQ ID:4360, and is provided hereinbelow with reference to the sequence

listing part.

[55746] VGAM1649 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1649 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1649 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[55747] VGAM1649 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1649 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1649 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1649 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM1649 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[55748] The complementary binding of VGAM1649 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1649 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1649 host target RNA into VGAM1649 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[55749] It is appreciated that VGAM1649 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1649 host target genes. The mRNA of each one of this plurality of VGAM1649 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1649 RNA, herein designated VGAM

RNA, and which when bound by VGAM1649 RNA causes inhibition of translation of respective one or more VGAM1649 host target proteins.

[55750] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1649 gene, herein designated VGAM GENE, on one or more VGAM1649 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[55751] It is yet further appreciated that a function of VGAM1649 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1649 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 8. Specific functions, and accordingly utilities, of VGAM1649 correlate with, and may be deduced from, the identity of the host target genes which VGAM1649 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[55752] Nucleotide sequences of the VGAM1649 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1649 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1649 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1649 are further described hereinbelow with reference to Table 1.

[55753] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1649 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1649 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[55754] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1649 gene, herein designated VGAM is

inhibition of expression of VGAM1649 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1649 correlate with, and may be deduced from, the identity of the target genes which VGAM1649 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[55755] Cholinergic Receptor, Nicotinic, Alpha Polypeptide 4 (CHRNA4, Accession NM\_000744) is a VGAM1649 host target gene. CHRNA4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHRNA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHRNA4 BINDING SITE, designated SEQ ID:6397, to the nucleotide sequence of VGAM1649 RNA, herein designated VGAM RNA, also designated SEQ ID:4360.

[55756] A function of VGAM1649 is therefore inhibition of Cholinergic Receptor, Nicotinic, Alpha Polypeptide 4 (CHRNA4, Accession NM\_000744), a gene which binds acetylcholine and opens an ion-conducting channel across the plasma membrane. Accordingly, utilities of VGAM1649 include diagnosis, prevention and treatment of diseases and clinical

conditions associated with CHRNA4. The function of CHRNA4 has been established by previous studies. Type 1 benign neonatal epilepsy (EBN1) was shown to be caused by mutations in the KCNQ2 gene (OMIM Ref. No. 602235) (Singh et al., 1998). The finding of a presumed mutation (Beck et al., 1994) in the CHRNA4 gene, which maps to the same region, in 1 of 20 families, was presumably an error. Steinlein et al. (1995) demonstrated a missense mutation in the CHRNA4 gene (118504.0002) associated with autosomal dominant nocturnal frontal lobe epilepsy (OMIM Ref. No. 600513), which had previously been mapped to 20q. Indeed, the mutation was sought because CHRNA4 maps to the same region of 20q and the gene is expressed in all layers of the frontal cortex. Mutations in the CHRNA4 gene appear to account for only a small proportion of the cases of nocturnal frontal lobe epilepsy. In a large Australian kindred, autosomal dominant nocturnal frontal lobe epilepsy was mapped to 20q13.2–q13.3 by Phillips et al. (1995). In affected members of the same family, Steinlein et al. (1995) used single-strand conformation analysis to detect an abnormality which by direct sequencing was demonstrated to be a C-to-T transition. It resulted in replacement of the neutral serine by the com-

plex aromatic phenylalanine (ser248-to-phe) in the sixth amino acid position of the transmembrane domain 2 (M2). They suggested that the mutation caused reduced receptor function. Forman et al. (1996) suggested an alternative mechanism for pathogenesis of epilepsy associated with this CHRNA4 mutation. From studies of the mouse muscle alpha-1 nicotinic receptor (OMIM Ref. No. 100690) noted in Forman et al. (1995), Forman et al. (1996) speculated that the mutation in CHRNA4 may cause receptor hyperactivity that could lead to epileptic activity. Animal model experiments lend further support to the function of CHRNA4. Marubio et al. (1999) disrupted the alpha-4 subunit of the neuronal nicotinic acetylcholine receptor by homologous recombination and studied homozygous alpha-4 null mice and mice lacking the beta-2 subunit of the nAChR. The homozygous alpha-4  $-/-$  mice no longer expressed high-affinity nicotine binding sites throughout the brain. In addition, both types of mutant mice displayed a reduced antinociceptive effect of nicotine on the hot-plate test and diminished sensitivity to nicotine in the tail-flick test. Patch-clamp recordings revealed that raphe magnus and thalamic neurons no longer responded to nicotine. Marubio et al. (1999) stated that the alpha-4

nAChR subunit, thought to associate with the beta-2 nAChR subunit, is therefore crucial for nicotine-elicited antinociception.

[55757] It is appreciated that the abovementioned animal model for CHRNA4 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[55758] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[55759] Steinlein, O. K.; Mulley, J. C.; Propping, P.; Wallace, R. H.; Phillips, H. A.; Sutherland, G. R.; Scheffer, I. E.; Berkovic, S. F. : A missense mutation in the neuronal nicotinic acetylcholine receptor alpha-4 subunit is associated with autosomal dominant nocturnal frontal lobe epilepsy. *Nature Genet.* 11: 201-203, 1995. ; and

[55760] Forman, S. A.; Yellen, G.; Thiele, E. A. : Alternative mechanism for pathogenesis of an inherited epilepsy by a nicotinic AChR mutation. (Letter) *Nature Genet.* 13: 396-397, 1996.

[55761] Further studies establishing the function and utilities of CHRNA4 are found in John Hopkins OMIM database record ID 118504, and in cited publications numbered 4452,

4662, 394–398, 7207–7208, 39 and 4663–403 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Coagulation Factor VII (serum prothrombin conversion accelerator) (F7, Accession NM\_000131) is another VGAM1649 host target gene. F7 BINDING SITE1 and F7 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by F7, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of F7 BINDING SITE1 and F7 BINDING SITE2, designated SEQ ID:5605 and SEQ ID:21234 respectively, to the nucleotide sequence of VGAM1649 RNA, herein designated VGAM RNA, also designated SEQ ID:4360.

[55762] Another function of VGAM1649 is therefore inhibition of Coagulation Factor VII (serum prothrombin conversion accelerator) (F7, Accession NM\_000131). Accordingly, utilities of VGAM1649 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F7. KIAA0435 (Accession NM\_014801) is another VGAM1649 host target gene. KIAA0435 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA0435, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0435 BINDING SITE, designated SEQ ID:16722, to the nucleotide sequence of VGAM1649 RNA, herein designated VGAM RNA, also designated SEQ ID:4360.

[55763] Another function of VGAM1649 is therefore inhibition of KIAA0435 (Accession NM\_014801). Accordingly, utilities of VGAM1649 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0435. LOC154214 (Accession XM\_087876) is another VGAM1649 host target gene. LOC154214 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154214, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154214 BINDING SITE, designated SEQ ID:39466, to the nucleotide sequence of VGAM1649 RNA, herein designated VGAM RNA, also designated SEQ ID:4360.

[55764] Another function of VGAM1649 is therefore inhibition of LOC154214 (Accession XM\_087876). Accordingly, utilities

of VGAM1649 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154214. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1650 (VGAM1650) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[55765] VGAM1650 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1650 was detected is described hereinabove with reference to Figs. 1-8.

[55766] VGAM1650 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 8. VGAM1650 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[55767] VGAM1650 gene encodes a VGAM1650 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1650 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM1650 precursor RNA is designated SEQ ID:1636, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1636 is located at position 109181 relative to the genome of Human Herpesvirus 8.

[55768] VGAM1650 precursor RNA folds onto itself, forming VGAM1650 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[55769] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1650 folded precursor RNA into VGAM1650 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM1650 RNA is designated SEQ ID:4361, and

is provided hereinbelow with reference to the sequence listing part.

[55770] VGAM1650 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1650 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1650 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[55771] VGAM1650 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1650 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1650 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM1650 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1650 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[55772] The complementary binding of VGAM1650 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1650 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1650 host target RNA into VGAM1650 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[55773] It is appreciated that VGAM1650 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1650 host target genes. The mRNA of each one of this plurality of VGAM1650 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1650 RNA, herein designated VGAM RNA, and which when bound by VGAM1650 RNA causes inhibition of translation of respective one or more VGAM1650 host target proteins.

[55774] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1650 gene, herein designated VGAM GENE, on one or more VGAM1650 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[55775] It is yet further appreciated that a function of VGAM1650 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1650 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 8. Specific functions, and accordingly utilities, of VGAM1650 correlate with, and may be deduced from, the identity of the host target genes which VGAM1650 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[55776] Nucleotide sequences of the VGAM1650 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1650 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1650 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1650 are further described hereinbelow with reference to Table 1.

[55777] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1650 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1650 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[55778] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM1650 gene, herein designated VGAM is inhibition of expression of VGAM1650 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1650 correlate with, and may be deduced from, the identity of the target genes which VGAM1650 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[55779] SNL (Accession NM\_003088) is a VGAM1650 host target gene. SNL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SNL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNL BINDING SITE, designated SEQ ID:9058, to the nucleotide sequence of VGAM1650 RNA, herein designated VGAM RNA, also designated SEQ ID:4361.

[55780] A function of VGAM1650 is therefore inhibition of SNL (Accession NM\_003088), a gene which organizes filamentous actin into bundles with a minimum of 4.1:1 actin/fascin ratio. Accordingly, utilities of VGAM1650 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNL. The function of SNL and its association with various diseases and clinical con-

ditions, has been established by previous studies, as described hereinabove with reference to VGAM675.DKFZp761A132 (Accession NM\_032296) is another VGAM1650 host target gene. DKFZp761A132 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp761A132, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761A132 BINDING SITE, designated SEQ ID:26076, to the nucleotide sequence of VGAM1650 RNA, herein designated VGAM RNA, also designated SEQ ID:4361.

[55781] Another function of VGAM1650 is therefore inhibition of DKFZp761A132 (Accession NM\_032296). Accordingly, utilities of VGAM1650 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761A132. GMPPB (Accession XM\_171044) is another VGAM1650 host target gene. GMPPB BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GMPPB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of GMPPB BINDING SITE, designated SEQ ID:45814, to the nucleotide sequence of VGAM1650 RNA, herein designated VGAM RNA, also designated SEQ ID:4361.

[55782] Another function of VGAM1650 is therefore inhibition of GMPPB (Accession XM\_171044). Accordingly, utilities of VGAM1650 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GMPPB. KIAA0125 (Accession XM\_018203) is another VGAM1650 host target gene. KIAA0125 BINDING SITE1 and KIAA0125 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA0125, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0125 BINDING SITE1 and KIAA0125 BINDING SITE2, designated SEQ ID:30343 and SEQ ID:16689 respectively, to the nucleotide sequence of VGAM1650 RNA, herein designated VGAM RNA, also designated SEQ ID:4361.

[55783] Another function of VGAM1650 is therefore inhibition of KIAA0125 (Accession XM\_018203). Accordingly, utilities of VGAM1650 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0125. LOC143437 (Accession XM\_096426) is another VGAM1650 host target gene. LOC143437 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC143437, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143437 BINDING SITE, designated SEQ ID:40358, to the nucleotide sequence of VGAM1650 RNA, herein designated VGAM RNA, also designated SEQ ID:4361.

[55784] Another function of VGAM1650 is therefore inhibition of LOC143437 (Accession XM\_096426). Accordingly, utilities of VGAM1650 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143437. LOC145989 (Accession XM\_004815) is another VGAM1650 host target gene. LOC145989 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145989, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145989 BINDING SITE, designated SEQ ID:29949, to the nucleotide sequence of VGAM1650 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4361.

[55785] Another function of VGAM1650 is therefore inhibition of LOC145989 (Accession XM\_004815). Accordingly, utilities of VGAM1650 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145989. LOC253531 (Accession XM\_172868) is another VGAM1650 host target gene. LOC253531 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253531, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253531 BINDING SITE, designated SEQ ID:46145, to the nucleotide sequence of VGAM1650 RNA, herein designated VGAM RNA, also designated SEQ ID:4361.

[55786] Another function of VGAM1650 is therefore inhibition of LOC253531 (Accession XM\_172868). Accordingly, utilities of VGAM1650 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253531. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1651 (VGAM1651) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[55787] VGAM1651 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1651 was detected is described hereinabove with reference to Figs. 1–8.

[55788] VGAM1651 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 8. VGAM1651 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[55789] VGAM1651 gene encodes a VGAM1651 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1651 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1651 precursor RNA is designated SEQ ID:1637, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1637 is located at position 106255 relative to the genome of Human Herpesvirus 8.

[55790] VGAM1651 precursor RNA folds onto itself, forming

VGAM1651 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[55791] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1651 folded precursor RNA into VGAM1651 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of VGAM1651 RNA is designated SEQ ID:4362, and is provided hereinbelow with reference to the sequence listing part.

[55792] VGAM1651 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1651 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1651 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[55793] VGAM1651 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1651 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1651 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1651 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1651 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[55794] The complementary binding of VGAM1651 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1651 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1651 host target RNA into VGAM1651 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[55795] It is appreciated that VGAM1651 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1651 host target genes. The mRNA of each one of this plurality of VGAM1651 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1651 RNA, herein designated VGAM RNA, and which when bound by VGAM1651 RNA causes inhibition of translation of respective one or more VGAM1651 host target proteins.

[55796] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1651 gene, herein designated VGAM GENE, on one or more VGAM1651 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[55797] It is yet further appreciated that a function of VGAM1651 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1651 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 8. Specific functions, and accordingly utilities, of VGAM1651 correlate with, and may be deduced from, the identity of the host target genes which VGAM1651 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[55798] Nucleotide sequences of the VGAM1651 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1651 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1651 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1651 are further described hereinbelow with reference to Table 1.

[55799] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1651 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1651 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[55800] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1651 gene, herein designated VGAM is inhibition of expression of VGAM1651 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1651 correlate with, and may be deduced from, the identity of the target genes which VGAM1651 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[55801] V-abl Abelson Murine Leukemia Viral Oncogene Homolog 1 (ABL1, Accession NM\_005157) is a VGAM1651 host target gene. ABL1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ABL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABL1 BINDING SITE, designated SEQ ID:11639, to the nucleotide sequence of VGAM1651 RNA, herein designated VGAM RNA, also designated SEQ ID:4362.

[55802] A function of VGAM1651 is therefore inhibition of V-abl Abelson Murine Leukemia Viral Oncogene Homolog 1 (ABL1, Accession NM\_005157). Accordingly, utilities of VGAM1651 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABL1. Chromosome 1 Open Reading Frame 17 (C1orf17, Accession XM\_042965) is another VGAM1651 host target gene. C1orf17 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by C1orf17, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of C1orf17 BINDING SITE, designated SEQ ID:33854, to the nucleotide sequence of VGAM1651 RNA, herein designated VGAM RNA, also designated SEQ ID:4362.

[55803] Another function of VGAM1651 is therefore inhibition of Chromosome 1 Open Reading Frame 17 (C1orf17, Accession XM\_042965). Accordingly, utilities of VGAM1651 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf17. Chromosome 1 Open Reading Frame 34 (C1orf34, Accession XM\_027172) is another VGAM1651 host target gene. C1orf34 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C1orf34, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf34 BINDING SITE, designated SEQ ID:30432, to the nucleotide sequence of VGAM1651 RNA, herein designated VGAM RNA, also designated SEQ ID:4362.

[55804] Another function of VGAM1651 is therefore inhibition of Chromosome 1 Open Reading Frame 34 (C1orf34, Accession XM\_027172). Accordingly, utilities of VGAM1651 in-

clude diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf34. Chondrolectin (CHODL, Accession NM\_024944) is another VGAM1651 host target gene. CHODL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHODL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHODL BINDING SITE, designated SEQ ID:24493, to the nucleotide sequence of VGAM1651 RNA, herein designated VGAM RNA, also designated SEQ ID:4362.

[55805] Another function of VGAM1651 is therefore inhibition of Chondrolectin (CHODL, Accession NM\_024944). Accordingly, utilities of VGAM1651 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHODL. DJ465N24.2.1 (Accession NM\_020317) is another VGAM1651 host target gene. DJ465N24.2.1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DJ465N24.2.1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of DJ465N24.2.1 BINDING SITE, designated SEQ ID:21580, to the nucleotide sequence of VGAM1651 RNA, herein designated VGAM RNA, also designated SEQ ID:4362.

[55806] Another function of VGAM1651 is therefore inhibition of DJ465N24.2.1 (Accession NM\_020317). Accordingly, utilities of VGAM1651 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DJ465N24.2.1. DKFZp547I014 (Accession NM\_020217) is another VGAM1651 host target gene. DKFZp547I014 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZp547I014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547I014 BINDING SITE, designated SEQ ID:21469, to the nucleotide sequence of VGAM1651 RNA, herein designated VGAM RNA, also designated SEQ ID:4362.

[55807] Another function of VGAM1651 is therefore inhibition of DKFZp547I014 (Accession NM\_020217). Accordingly, utilities of VGAM1651 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with DKFZp547I014. FLJ13052 (Accession NM\_023018) is another VGAM1651 host target gene. FLJ13052 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13052, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13052 BINDING SITE, designated SEQ ID:23284, to the nucleotide sequence of VGAM1651 RNA, herein designated VGAM RNA, also designated SEQ ID:4362.

[55808] Another function of VGAM1651 is therefore inhibition of FLJ13052 (Accession NM\_023018). Accordingly, utilities of VGAM1651 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13052. KIAA0350 (Accession XM\_028332) is another VGAM1651 host target gene. KIAA0350 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0350, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0350 BINDING SITE, designated SEQ ID:30659, to the nucleotide sequence of VGAM1651 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4362.

[55809] Another function of VGAM1651 is therefore inhibition of KIAA0350 (Accession XM\_028332). Accordingly, utilities of VGAM1651 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0350. KIAA0980 (Accession NM\_025176) is another VGAM1651 host target gene. KIAA0980 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0980, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0980 BINDING SITE, designated SEQ ID:24810, to the nucleotide sequence of VGAM1651 RNA, herein designated VGAM RNA, also designated SEQ ID:4362.

[55810] Another function of VGAM1651 is therefore inhibition of KIAA0980 (Accession NM\_025176). Accordingly, utilities of VGAM1651 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0980. KIAA1529 (Accession XM\_047336) is another VGAM1651 host target gene. KIAA1529 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1529, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1529 BINDING SITE, designated SEQ ID:34949, to the nucleotide sequence of VGAM1651 RNA, herein designated VGAM RNA, also designated SEQ ID:4362.

[55811] Another function of VGAM1651 is therefore inhibition of KIAA1529 (Accession XM\_047336). Accordingly, utilities of VGAM1651 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1529. KIAA1617 (Accession XM\_166140) is another VGAM1651 host target gene. KIAA1617 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1617, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1617 BINDING SITE, designated SEQ ID:43943, to the nucleotide sequence of VGAM1651 RNA, herein designated VGAM RNA, also designated SEQ ID:4362.

[55812] Another function of VGAM1651 is therefore inhibition of KIAA1617 (Accession XM\_166140). Accordingly, utilities of VGAM1651 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1617. KIAA1729 (Accession XM\_114418) is another VGAM1651 host target gene. KIAA1729 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1729, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1729 BINDING SITE, designated SEQ ID:42952, to the nucleotide sequence of VGAM1651 RNA, herein designated VGAM RNA, also designated SEQ ID:4362.

[55813] Another function of VGAM1651 is therefore inhibition of KIAA1729 (Accession XM\_114418). Accordingly, utilities of VGAM1651 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1729. V-maf Musculoaponeurotic Fibrosarcoma Oncogene Homolog B (avian) (MAFB, Accession NM\_005461) is another VGAM1651 host target gene. MAFB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MAFB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of MAFB BINDING SITE, designated SEQ ID:11944, to the nucleotide sequence of VGAM1651 RNA, herein designated VGAM RNA, also designated SEQ ID:4362.

[55814] Another function of VGAM1651 is therefore inhibition of V-maf Musculoaponeurotic Fibrosarcoma Oncogene Homolog B (avian) (MAFB, Accession NM\_005461). Accordingly, utilities of VGAM1651 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAFB. MGC13040 (Accession NM\_032930) is another VGAM1651 host target gene. MGC13040 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC13040, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13040 BINDING SITE, designated SEQ ID:26754, to the nucleotide sequence of VGAM1651 RNA, herein designated VGAM RNA, also designated SEQ ID:4362.

[55815] Another function of VGAM1651 is therefore inhibition of MGC13040 (Accession NM\_032930). Accordingly, utilities of VGAM1651 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13040. MIC2 Like 1 (MIC2L1, Accession NM\_031462)

is another VGAM1651 host target gene. MIC2L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MIC2L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MIC2L1 BINDING SITE, designated SEQ ID:25487, to the nucleotide sequence of VGAM1651 RNA, herein designated VGAM RNA, also designated SEQ ID:4362.

[55816] Another function of VGAM1651 is therefore inhibition of MIC2 Like 1 (MIC2L1, Accession NM\_031462). Accordingly, utilities of VGAM1651 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MIC2L1. RAI (Accession NM\_006663) is another VGAM1651 host target gene. RAI BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RAI, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAI BINDING SITE, designated SEQ ID:13473, to the nucleotide sequence of VGAM1651 RNA, herein designated VGAM RNA, also designated SEQ ID:4362.

[55817] Another function of VGAM1651 is therefore inhibition of RAI (Accession NM\_006663). Accordingly, utilities of VGAM1651 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAI. LOC152059 (Accession XM\_087372) is another VGAM1651 host target gene. LOC152059 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152059, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152059 BINDING SITE, designated SEQ ID:39206, to the nucleotide sequence of VGAM1651 RNA, herein designated VGAM RNA, also designated SEQ ID:4362.

[55818] Another function of VGAM1651 is therefore inhibition of LOC152059 (Accession XM\_087372). Accordingly, utilities of VGAM1651 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152059. LOC152404 (Accession XM\_087460) is another VGAM1651 host target gene. LOC152404 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152404, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152404 BINDING SITE, designated SEQ ID:39272, to the nucleotide sequence of VGAM1651 RNA, herein designated VGAM RNA, also designated SEQ ID:4362.

[55819] Another function of VGAM1651 is therefore inhibition of LOC152404 (Accession XM\_087460). Accordingly, utilities of VGAM1651 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152404. LOC197414 (Accession XM\_113880) is another VGAM1651 host target gene. LOC197414 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC197414, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197414 BINDING SITE, designated SEQ ID:42516, to the nucleotide sequence of VGAM1651 RNA, herein designated VGAM RNA, also designated SEQ ID:4362.

[55820] Another function of VGAM1651 is therefore inhibition of LOC197414 (Accession XM\_113880). Accordingly, utilities of VGAM1651 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC197414. LOC221463 (Accession XM\_166374) is another VGAM1651 host target gene. LOC221463 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221463, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221463 BINDING SITE, designated SEQ ID:44197, to the nucleotide sequence of VGAM1651 RNA, herein designated VGAM RNA, also designated SEQ ID:4362.

[55821] Another function of VGAM1651 is therefore inhibition of LOC221463 (Accession XM\_166374). Accordingly, utilities of VGAM1651 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221463. LOC256222 (Accession XM\_173177) is another VGAM1651 host target gene. LOC256222 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256222, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256222 BINDING SITE, designated SEQ ID:46426, to the nucleotide sequence of VGAM1651 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4362.

[55822] Another function of VGAM1651 is therefore inhibition of LOC256222 (Accession XM\_173177). Accordingly, utilities of VGAM1651 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256222. LOC57109 (Accession NM\_020385) is another VGAM1651 host target gene. LOC57109 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC57109, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC57109 BINDING SITE, designated SEQ ID:21654, to the nucleotide sequence of VGAM1651 RNA, herein designated VGAM RNA, also designated SEQ ID:4362.

[55823] Another function of VGAM1651 is therefore inhibition of LOC57109 (Accession NM\_020385). Accordingly, utilities of VGAM1651 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC57109. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1652 (VGAM1652) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[55824] VGAM1652 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1652 was detected is described hereinabove with reference to Figs. 1–8.

[55825] VGAM1652 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Yellow Fever Virus. VGAM1652 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[55826] VGAM1652 gene encodes a VGAM1652 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1652 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1652 precursor RNA is designated SEQ ID:1638, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1638 is located at position 10776 relative to the genome of Yellow Fever Virus.

[55827] VGAM1652 precursor RNA folds onto itself, forming

VGAM1652 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[55828] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1652 folded precursor RNA into VGAM1652 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM1652 RNA is designated SEQ ID:4363, and is provided hereinbelow with reference to the sequence listing part.

[55829] VGAM1652 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1652 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1652 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[55830] VGAM1652 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1652 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1652 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1652 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1652 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[55831] The complementary binding of VGAM1652 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1652 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1652 host target RNA into VGAM1652 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[55832] It is appreciated that VGAM1652 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1652 host target genes. The mRNA of each one of this plurality of VGAM1652 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1652 RNA, herein designated VGAM RNA, and which when bound by VGAM1652 RNA causes inhibition of translation of respective one or more VGAM1652 host target proteins.

[55833] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1652 gene, herein designated VGAM GENE, on one or more VGAM1652 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[55834] It is yet further appreciated that a function of VGAM1652 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of viral infection by Yellow Fever Virus. Specific functions, and accordingly utilities, of VGAM1652 correlate with, and may be deduced from, the identity of the host target genes which VGAM1652 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[55835] Nucleotide sequences of the VGAM1652 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1652 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1652 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1652 are further described hereinbelow with reference to Table 1.

[55836] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1652 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1652 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[55837] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1652 gene, herein designated VGAM is inhibition of expression of VGAM1652 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1652 correlate with, and may be deduced from, the identity of the target genes which VGAM1652 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[55838] Aryl–hydrocarbon Receptor Nuclear Translocator 2 (ARNT2, Accession NM\_014862) is a VGAM1652 host target gene. ARNT2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ARNT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARNT2 BINDING SITE, designated SEQ ID:16937, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55839] A function of VGAM1652 is therefore inhibition of Aryl–hydrocarbon Receptor Nuclear Translocator 2 (ARNT2, Accession NM\_014862), a gene which specifically recognizes the xenobiotic response element (xre). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARNT2. The function of ARNT2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM345.Cholinergic Receptor, Nicotinic, Alpha Polypeptide 4 (CHRNA4, Accession

NM\_000744) is another VGAM1652 host target gene.

CHRNA4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHRNA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHRNA4 BINDING SITE, designated SEQ ID:6398, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55840] Another function of VGAM1652 is therefore inhibition of Cholinergic Receptor, Nicotinic, Alpha Polypeptide 4 (CHRNA4, Accession NM\_000744), a gene which binds acetylcholine and opens an ion-conducting channel across the plasma membrane. Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHRNA4. The function of CHRNA4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1649. DiGeorge Syndrome Critical Region Gene 2 (DGCR2, Accession NM\_005137) is another VGAM1652 host target gene. DGCR2 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by DGCR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DGCR2 BINDING SITE, designated SEQ ID:11612, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55841] Another function of VGAM1652 is therefore inhibition of DiGeorge Syndrome Critical Region Gene 2 (DGCR2, Accession NM\_005137), a gene which could intervene in cell-cell or cell-matrix interactions. Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DGCR2. The function of DGCR2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1485. Ectodermal Dysplasia 1, Anhidrotic (ED1, Accession NM\_001399) is another VGAM1652 host target gene. ED1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ED1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

**BINDING SITE III.** Table 2 illustrates the complementarity of the nucleotide sequences of ED1 BINDING SITE, designated SEQ ID:7100, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55842] Another function of VGAM1652 is therefore inhibition of Ectodermal Dysplasia 1, Anhidrotic (ED1, Accession NM\_001399). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ED1. Ephrin-B1 (EFNB1, Accession NM\_004429) is another VGAM1652 host target gene. EFNB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EFNB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EFNB1 BINDING SITE, designated SEQ ID:10709, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55843] Another function of VGAM1652 is therefore inhibition of Ephrin-B1 (EFNB1, Accession NM\_004429), a gene which is a transmembrane ligand of Eph-related receptor tyro-

sine kinases, has a role in cell adhesion. Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EFN1. The function of EFN1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM390. Glucagon-like Peptide 1 Receptor (GLP1R, Accession NM\_002062) is another VGAM1652 host target gene. GLP1R BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GLP1R, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GLP1R BINDING SITE, designated SEQ ID:7825, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55844] Another function of VGAM1652 is therefore inhibition of Glucagon-like Peptide 1 Receptor (GLP1R, Accession NM\_002062), a gene which is mediated by g proteins which activate adenylyl cyclase. Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GLP1R.

The function of GLP1R has been established by previous studies. Glucagon-like peptide-1 (GLP1) is a hormone derived from the proglucagon molecule (OMIM Ref. No. 138030) and is secreted by intestinal L cells. It is the most potent stimulator of glucose-induced insulin secretion and also suppresses in vivo acid secretion by gastric glands. By transient expression of a rat pancreatic islet cDNA library in COS cells, Thorens (1992) isolated a cDNA for the GLP1 receptor (GLP1R). Transfected into COS cells, the receptor bound GLP1 with high affinity and was coupled to activation of adenylate cyclase. It did not bind peptides of related structure and similar function, such as glucagon (GCG; 138030), gastric inhibitory polypeptide (GIP; 137240), vasoactive intestinal peptide (VIP; 192320), or secretin (SCT; 182099). The receptor is 463 amino acids long and contains 7 transmembrane domains. Sequence homology was found only with the receptors for secretin (SCTR; 182098), calcitonin (CALCR; 114131), and parathyroid hormone (PTHr; 168468), which together form a newly characterized family of G-coupled receptors. Dillon et al. (1993) also cloned a cDNA corresponding to the GLP1R gene. By promoter analysis and electrophoretic mobility shift analysis, Wildhage et al. (1999) showed that

the GLP1R promoter binds both SP1 (OMIM Ref. No. 189906) and SP3 (OMIM Ref. No. 601804). They concluded that the basal activity of the GLP1R gene is mediated by 2 proximal SP1-binding sites and that a more distal site acts as a repressor.

[55845] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[55846] Dillon, J. S.; Tanizawa, Y.; Wheeler, M. B.; Leng, X.-H.; Ligon, B. B.; Rabin, D. U.; Yoo-Warren, H.; Permutt, M. A.; Boyd, A. E., III : Cloning and functional expression of the human glucagon-like peptide-1 (GLP-1) receptor. *Endocrinology* 133: 1907-1910, 1993. ; and

[55847] Wildhage, I.; Trusheim, H.; Goke, B.; Lankat-Buttgereit, B. : Gene expression of the human glucagon-like peptide-1 receptor is regulated by Sp1 and Sp3. *Endocrinology* 140: 624-631, 1999.

[55848] Further studies establishing the function and utilities of GLP1R are found in John Hopkins OMIM database record ID 138032, and in cited publications numbered 3167-317 and 3356 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Inositol Hexaphosphate Kinase 1 (IHPK1, Accession XM\_171045) is

another VGAM1652 host target gene. IHPK1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IHPK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IHPK1 BINDING SITE, designated SEQ ID:45822, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55849] Another function of VGAM1652 is therefore inhibition of Inositol Hexaphosphate Kinase 1 (IHPK1, Accession XM\_171045), a gene which is a messenger molecule that releases calcium from intracellular stores. Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IHPK1. The function of IHPK1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1061. Interleukin 1 Family, Member 5 (delta) (IL1F5, Accession NM\_012275) is another VGAM1652 host target gene. IL1F5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IL1F5, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL1F5 BINDING SITE, designated SEQ ID:14597, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55850] Another function of VGAM1652 is therefore inhibition of Interleukin 1 Family, Member 5 (delta) (IL1F5, Accession NM\_012275), a gene which is a novel interleukin-1 receptor antagonist gene. Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL1F5. The function of IL1F5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM263. Jumping Translocation Breakpoint (JTB, Accession NM\_006694) is another VGAM1652 host target gene. JTB BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by JTB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JTB BINDING SITE, designated SEQ ID:13514, to the nu-

cleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55851] Another function of VGAM1652 is therefore inhibition of Jumping Translocation Breakpoint (JTB, Accession NM\_006694). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JTB. Leukemia Inhibitory Factor (cholinergic differentiation factor) (LIF, Accession NM\_002309) is another VGAM1652 host target gene. LIF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LIF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIF BINDING SITE, designated SEQ ID:8096, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55852] Another function of VGAM1652 is therefore inhibition of Leukemia Inhibitory Factor (cholinergic differentiation factor) (LIF, Accession NM\_002309). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIF. Multiple Endocrine Neoplasia I (MEN1, Accession

XM\_167804) is another VGAM1652 host target gene.

MEN1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MEN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEN1 BINDING SITE, designated SEQ ID:44841, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55853] Another function of VGAM1652 is therefore inhibition of Multiple Endocrine Neoplasia I (MEN1, Accession XM\_167804). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEN1. Male-specific Lethal 3-like 1 (Drosophila) (MSL3L1, Accession NM\_006800) is another VGAM1652 host target gene. MSL3L1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MSL3L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MSL3L1 BINDING SITE, designated SEQ ID:13670, to the nucleotide sequence of VGAM1652 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4363.

[55854] Another function of VGAM1652 is therefore inhibition of Male-specific Lethal 3-like 1 (Drosophila) (MSL3L1, Accession NM\_006800). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MSL3L1. Phosphoinositide-3-kinase, Class 2, Beta Polypeptide (PIK3C2B, Accession NM\_002646) is another VGAM1652 host target gene. PIK3C2B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PIK3C2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIK3C2B BINDING SITE, designated SEQ ID:8506, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55855] Another function of VGAM1652 is therefore inhibition of Phosphoinositide-3-kinase, Class 2, Beta Polypeptide (PIK3C2B, Accession NM\_002646). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIK3C2B. Phosphomannomutase 2 (PMM2, Accession

XM\_050755) is another VGAM1652 host target gene.

PMM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PMM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PMM2 BINDING SITE, designated SEQ ID:35678, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55856] Another function of VGAM1652 is therefore inhibition of Phosphomannomutase 2 (PMM2, Accession XM\_050755). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PMM2. Prokineticin 1 (PROK1, Accession NM\_032414) is another VGAM1652 host target gene. PROK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PROK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PROK1 BINDING SITE, designated SEQ ID:26198, to the nucleotide sequence of VGAM1652 RNA,

herein designated VGAM RNA, also designated SEQ ID:4363.

[55857] Another function of VGAM1652 is therefore inhibition of Prokineticin 1 (PROK1, Accession NM\_032414), a gene which induces proliferation, migration and fenestration in capillary endothelial cells derived from endocrine glands. Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PROK1. The function of PROK1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1000.SH3-domain Binding Protein 2 (SH3BP2, Accession NM\_003023) is another VGAM1652 host target gene. SH3BP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SH3BP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SH3BP2 BINDING SITE, designated SEQ ID:8945, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55858] Another function of VGAM1652 is therefore inhibition of SH3-domain Binding Protein 2 (SH3BP2, Accession NM\_003023). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SH3BP2. Solute Carrier Family 22 (organic anion/cation transporter), Member 12 (SLC22A12, Accession NM\_144585) is another VGAM1652 host target gene. SLC22A12 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SLC22A12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC22A12 BINDING SITE, designated SEQ ID:29404, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55859] Another function of VGAM1652 is therefore inhibition of Solute Carrier Family 22 (organic anion/cation transporter), Member 12 (SLC22A12, Accession NM\_144585), a gene which is a urate -anion exchanger regulating blood urate levels. Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC22A12. The function of

SLC22A12 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1034. Secreted Protein, Acidic, Cysteine-rich (osteonectin) (SPARC, Accession NM\_003118) is another VGAM1652 host target gene. SPARC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SPARC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPARC BINDING SITE, designated SEQ ID:9089, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55860] Another function of VGAM1652 is therefore inhibition of Secreted Protein, Acidic, Cysteine-rich (osteonectin) (SPARC, Accession NM\_003118), a gene which appears to regulate cell growth through interactions with the extracellular matrix and cytokines. binds calcium and copper, several types of collagen, albumin, thrombospondin, pdgf and cell membranes. Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPARC. The func-

tion of SPARC has been established by previous studies. PARC is identical to osteonectin (from Latin verb nectere, to bind, bridge or link), a protein important to bone calcification which was identified by Termine et al. (1981). It is a 32,000–dalton, bone–specific phosphoprotein that binds selectively to hydroxyapatite and to collagen fibrils at distinct sites. Osteonectin accounts for the unique property of bone collagen to undergo calcification; type I collagen of bone is identical to that of skin and tendon. In bone, it is present in a concentration of 2.3 micrograms per 10 micrograms of protein. It is present also in dentin but absent from all other tissues. By comparison of protein sequences as well as investigation of the genes, Findlay et al. (1988) concluded that osteonectin is highly conserved between species. Naylor et al. (1989) demonstrated RFLPs of the ON gene which should be useful as markers on chromosome 5 and for investigating the possible role of osteonectin in bone diseases. SPARC, which can be selectively expressed by the endothelium in response to certain types of injury, induces rounding in adherent endothelial cells in vitro. From the results of studies on the influence of SPARC on endothelial permeability, Goldblum et al. (1994) concluded that SPARC regulates endothelial

barrier function through F-actin-dependent changes in cell shape, coincident with the appearance of intercellular gaps, that provide a paracellular pathway for extravasation of macromolecules. Animal model experiments lend further support to the function of SPARC. Gilmour et al. (1998) generated mice deficient for SPARC by targeted disruption. SPARC-deficient mice appeared normal and fertile until around 6 months of age, when they developed severe eye pathology characterized by cataract formation and rupture of the lens capsule. The first sign of lens pathology occurred in the equatorial bow region where vacuoles gradually formed within differentiating epithelial cells and fiber cells. The lens capsule, however, showed no qualitative changes in the major basal lamina proteins laminin, collagen IV, perlecan, or entactin.

[55861] It is appreciated that the abovementioned animal model for SPARC is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[55862] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[55863] Gilmour, D. T.; Lyon, G. J.; Carlton, M. B. L.; Sanes, J. R.;

Cunningham, J. M.; Anderson, J. R.; Hogan, B. L. M.; Evans, M. J.; Colledge, W. H. : Mice deficient for the secreted glycoprotein SPARC/osteonectin/BM40 develop normally but show severe age-onset cataract formation and disruption of the lens. EMBO J. 17: 1860–1870, 1998. ; and

[55864] Le Beau et al. (1993) mapped the SPARC gene to 5q31.3–q32. SGoldblum, S. E.; Ding, X.; Funk, S. E.; Sage, E. H. : SPARC (secreted protein acidic and rich in cysteine) regulates endotheli.

[55865] Further studies establishing the function and utilities of SPARC are found in John Hopkins OMIM database record ID 182120, and in cited publications numbered 10706–10707, 1059 and 11667–10606 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. TH1-like (Drosophila) (TH1L, Accession NM\_016397) is another VGAM1652 host target gene. TH1L BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TH1L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TH1L BINDING SITE, designated SEQ ID:18537, to the nucleotide sequence of VGAM1652 RNA, herein

designated VGAM RNA, also designated SEQ ID:4363.

[55866] Another function of VGAM1652 is therefore inhibition of TH1-like (Drosophila) (TH1L, Accession NM\_016397). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TH1L. Transient Receptor Potential Cation Channel, Subfamily C, Member 1 (TRPC1, Accession NM\_003304) is another VGAM1652 host target gene. TRPC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRPC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPC1 BINDING SITE, designated SEQ ID:9307, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55867] Another function of VGAM1652 is therefore inhibition of Transient Receptor Potential Cation Channel, Subfamily C, Member 1 (TRPC1, Accession NM\_003304), a gene which acts as a non-voltage-sensitive store-operated  $Ca^{2+}$  channel. Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPC1. The function of TRPC1

and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200.AF9Q34 (Accession NM\_032552) is another VGAM1652 host target gene. AF9Q34 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by AF9Q34, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AF9Q34 BINDING SITE, designated SEQ ID:26275, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55868] Another function of VGAM1652 is therefore inhibition of AF9Q34 (Accession NM\_032552). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AF9Q34. Angiomotin Like 1 (AMOTL1, Accession XM\_057045) is another VGAM1652 host target gene. AMOTL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AMOTL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of AMOTL1 BINDING SITE, designated SEQ ID:36464, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55869] Another function of VGAM1652 is therefore inhibition of Angiomotin Like 1 (AMOTL1, Accession XM\_057045). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AMOTL1. Aquaporin 9 (AQP9, Accession NM\_020980) is another VGAM1652 host target gene. AQP9 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by AQP9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AQP9 BINDING SITE, designated SEQ ID:21970, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55870] Another function of VGAM1652 is therefore inhibition of Aquaporin 9 (AQP9, Accession NM\_020980). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with AQP9. ARNTL2 (Accession NM\_020183) is another VGAM1652 host target gene. ARNTL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARNTL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARNTL2 BINDING SITE, designated SEQ ID:21416, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55871] Another function of VGAM1652 is therefore inhibition of ARNTL2 (Accession NM\_020183). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARNTL2. Basic Leucine Zipper Nuclear Factor 1 (JEM-1) (BLZF1, Accession NM\_003666) is another VGAM1652 host target gene. BLZF1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by BLZF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BLZF1 BINDING SITE, designated SEQ ID:9750, to the nucleotide sequence of

VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55872] Another function of VGAM1652 is therefore inhibition of Basic Leucine Zipper Nuclear Factor 1 (JEM-1) (BLZF1, Accession NM\_003666). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BLZF1. Chromosome 20 Open Reading Frame 160 (C20orf160, Accession NM\_080625) is another VGAM1652 host target gene. C20orf160 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf160, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf160 BINDING SITE, designated SEQ ID:27933, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55873] Another function of VGAM1652 is therefore inhibition of Chromosome 20 Open Reading Frame 160 (C20orf160, Accession NM\_080625). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

C20orf160. DKFZP547E2110 (Accession XM\_165676) is another VGAM1652 host target gene. DKFZP547E2110 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP547E2110, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP547E2110 BINDING SITE, designated SEQ ID:43730, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55874] Another function of VGAM1652 is therefore inhibition of DKFZP547E2110 (Accession XM\_165676). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP547E2110. DKFZP586F1524 (Accession NM\_015584) is another VGAM1652 host target gene. DKFZP586F1524 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP586F1524, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP586F1524 BINDING SITE,

designated SEQ ID:17855, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55875] Another function of VGAM1652 is therefore inhibition of DKFZP586F1524 (Accession NM\_015584). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586F1524. Fatty Acid Desaturase 2 (FADS2, Accession NM\_004265) is another VGAM1652 host target gene. FADS2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FADS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FADS2 BINDING SITE, designated SEQ ID:10467, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55876] Another function of VGAM1652 is therefore inhibition of Fatty Acid Desaturase 2 (FADS2, Accession NM\_004265). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FADS2. FLJ00024 (Accession

XM\_033361) is another VGAM1652 host target gene. FLJ00024 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ00024, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ00024 BINDING SITE, designated SEQ ID:31895, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55877] Another function of VGAM1652 is therefore inhibition of FLJ00024 (Accession XM\_033361). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00024. FLJ10201 (Accession NM\_018023) is another VGAM1652 host target gene. FLJ10201 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10201, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10201 BINDING SITE, designated SEQ ID:19762, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM

RNA, also designated SEQ ID:4363.

[55878] Another function of VGAM1652 is therefore inhibition of FLJ10201 (Accession NM\_018023). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10201. FLJ10330 (Accession NM\_018061) is another VGAM1652 host target gene. FLJ10330 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10330, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10330 BINDING SITE, designated SEQ ID:19831, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55879] Another function of VGAM1652 is therefore inhibition of FLJ10330 (Accession NM\_018061). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10330. FLJ10604 (Accession NM\_018154) is another VGAM1652 host target gene. FLJ10604 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10604, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10604 BINDING SITE, designated SEQ ID:19963, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55880] Another function of VGAM1652 is therefore inhibition of FLJ10604 (Accession NM\_018154). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10604. FLJ13181 (Accession NM\_025188) is another VGAM1652 host target gene. FLJ13181 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ13181, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13181 BINDING SITE, designated SEQ ID:24827, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55881] Another function of VGAM1652 is therefore inhibition of FLJ13181 (Accession NM\_025188). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ13181. FLJ14050 (Accession XM\_016361) is another VGAM1652 host target gene. FLJ14050 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ14050, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14050 BINDING SITE, designated SEQ ID:30255, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55882] Another function of VGAM1652 is therefore inhibition of FLJ14050 (Accession XM\_016361). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14050. FLJ14084 (Accession NM\_021637) is another VGAM1652 host target gene. FLJ14084 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14084, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14084 BINDING SITE, designated SEQ ID:22283, to the nucleotide

sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55883] Another function of VGAM1652 is therefore inhibition of FLJ14084 (Accession NM\_021637). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14084. FLJ14346 (Accession NM\_025029) is another VGAM1652 host target gene. FLJ14346 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ14346, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14346 BINDING SITE, designated SEQ ID:24621, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55884] Another function of VGAM1652 is therefore inhibition of FLJ14346 (Accession NM\_025029). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14346. FLJ14816 (Accession NM\_032845) is another VGAM1652 host target gene. FLJ14816 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by FLJ14816, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14816 BINDING SITE, designated SEQ ID:26640, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55885] Another function of VGAM1652 is therefore inhibition of FLJ14816 (Accession NM\_032845). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14816. FLJ20297 (Accession NM\_017951) is another VGAM1652 host target gene. FLJ20297 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ20297, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20297 BINDING SITE, designated SEQ ID:19650, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55886] Another function of VGAM1652 is therefore inhibition of FLJ20297 (Accession NM\_017951). Accordingly, utilities of

VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20297. FLJ21313 (Accession NM\_023927) is another VGAM1652 host target gene. FLJ21313 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ21313, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21313 BINDING SITE, designated SEQ ID:23409, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55887] Another function of VGAM1652 is therefore inhibition of FLJ21313 (Accession NM\_023927). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21313. GOLGIN-67 (Accession XM\_170772) is another VGAM1652 host target gene. GOLGIN-67 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GOLGIN-67, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GOLGIN-

67 BINDING SITE, designated SEQ ID:45535, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55888] Another function of VGAM1652 is therefore inhibition of GOLGIN-67 (Accession XM\_170772). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GOLGIN-67. KIAA0229 (Accession XM\_166478) is another VGAM1652 host target gene. KIAA0229 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0229, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0229 BINDING SITE, designated SEQ ID:44400, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55889] Another function of VGAM1652 is therefore inhibition of KIAA0229 (Accession XM\_166478). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0229. KIAA0247 (Accession NM\_014734) is another VGAM1652 host target gene. KIAA0247 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0247, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0247 BINDING SITE, designated SEQ ID:16376, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55890] Another function of VGAM1652 is therefore inhibition of KIAA0247 (Accession NM\_014734). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0247. KIAA0275 (Accession NM\_014767) is another VGAM1652 host target gene. KIAA0275 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0275, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0275 BINDING SITE, designated SEQ ID:16550, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55891] Another function of VGAM1652 is therefore inhibition of

KIAA0275 (Accession NM\_014767). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0275. KIAA0596 (Accession XM\_031706) is another VGAM1652 host target gene. KIAA0596 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0596, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0596 BINDING SITE, designated SEQ ID:31467, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55892] Another function of VGAM1652 is therefore inhibition of KIAA0596 (Accession XM\_031706). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0596. KIAA0682 (Accession NM\_016196) is another VGAM1652 host target gene. KIAA0682 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0682, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0682 BINDING SITE, designated SEQ ID:18290, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55893] Another function of VGAM1652 is therefore inhibition of KIAA0682 (Accession NM\_016196). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0682. KIAA0855 (Accession NM\_015003) is another VGAM1652 host target gene. KIAA0855 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0855, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0855 BINDING SITE, designated SEQ ID:17374, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55894] Another function of VGAM1652 is therefore inhibition of KIAA0855 (Accession NM\_015003). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0855. KIAA0977 (Accession NM\_014900) is another

VGAM1652 host target gene. KIAA0977 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0977, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0977 BINDING SITE, designated SEQ ID:17082, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55895] Another function of VGAM1652 is therefore inhibition of KIAA0977 (Accession NM\_014900). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0977. KIAA1014 (Accession XM\_037205) is another VGAM1652 host target gene. KIAA1014 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1014 BINDING SITE, designated SEQ ID:32570, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55896] Another function of VGAM1652 is therefore inhibition of KIAA1014 (Accession XM\_037205). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1014. KIAA1322 (Accession XM\_052626) is another VGAM1652 host target gene. KIAA1322 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1322, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1322 BINDING SITE, designated SEQ ID:36030, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55897] Another function of VGAM1652 is therefore inhibition of KIAA1322 (Accession XM\_052626). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1322. KIAA1462 (Accession XM\_166132) is another VGAM1652 host target gene. KIAA1462 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1462, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1462 BINDING SITE, designated SEQ ID:43924, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55898] Another function of VGAM1652 is therefore inhibition of KIAA1462 (Accession XM\_166132). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1462. KIAA1497 (Accession XM\_041431) is another VGAM1652 host target gene. KIAA1497 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1497, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1497 BINDING SITE, designated SEQ ID:33529, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55899] Another function of VGAM1652 is therefore inhibition of KIAA1497 (Accession XM\_041431). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1497. KIAA1553 (Accession XM\_166320) is another VGAM1652 host target gene. KIAA1553 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1553, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1553 BINDING SITE, designated SEQ ID:44143, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55900] Another function of VGAM1652 is therefore inhibition of KIAA1553 (Accession XM\_166320). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1553. KIAA1940 (Accession XM\_086981) is another VGAM1652 host target gene. KIAA1940 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1940, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1940 BINDING SITE, designated SEQ ID:39010, to the nucleotide sequence of VGAM1652 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4363.

[55901] Another function of VGAM1652 is therefore inhibition of KIAA1940 (Accession XM\_086981). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1940. Kinesin Family Member 13B (KIF13B, Accession NM\_015254) is another VGAM1652 host target gene. KIF13B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIF13B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIF13B BINDING SITE, designated SEQ ID:17582, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55902] Another function of VGAM1652 is therefore inhibition of Kinesin Family Member 13B (KIF13B, Accession NM\_015254). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIF13B. MGC13061 (Accession NM\_032322) is another VGAM1652 host target gene. MGC13061 BINDING SITE is HOST TARGET binding

site found in the 3' untranslated region of mRNA encoded by MGC13061, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13061 BINDING SITE, designated SEQ ID:26127, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55903] Another function of VGAM1652 is therefore inhibition of MGC13061 (Accession NM\_032322). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13061. Neurogenic Differentiation 6 (NEUROD6, Accession NM\_022728) is another VGAM1652 host target gene. NEUROD6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NEUROD6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEUROD6 BINDING SITE, designated SEQ ID:22929, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55904] Another function of VGAM1652 is therefore inhibition of Neurogenic Differentiation 6 (NEUROD6, Accession NM\_022728). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEUROD6. NYD-SP29 (Accession XM\_059085) is another VGAM1652 host target gene. NYD-SP29 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NYD-SP29, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NYD-SP29 BINDING SITE, designated SEQ ID:36862, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55905] Another function of VGAM1652 is therefore inhibition of NYD-SP29 (Accession XM\_059085). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NYD-SP29. p25 (Accession NM\_007030) is another VGAM1652 host target gene. p25 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by p25, corresponding to a HOST TAR-

GET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of p25 BINDING SITE, designated SEQ ID:13895, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55906] Another function of VGAM1652 is therefore inhibition of p25 (Accession NM\_007030). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with p25. Parvin, Alpha (PARVA, Accession NM\_018222) is another VGAM1652 host target gene. PARVA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PARVA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PARVA BINDING SITE, designated SEQ ID:20146, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55907] Another function of VGAM1652 is therefore inhibition of Parvin, Alpha (PARVA, Accession NM\_018222). Accordingly, utilities of VGAM1652 include diagnosis, prevention

and treatment of diseases and clinical conditions associated with PARVA. RAS Protein Activator Like 2 (RASAL2, Accession NM\_004841) is another VGAM1652 host target gene. RASAL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RASAL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RASAL2 BINDING SITE, designated SEQ ID:11249, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55908] Another function of VGAM1652 is therefore inhibition of RAS Protein Activator Like 2 (RASAL2, Accession NM\_004841). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASAL2. Ring Finger Protein 38 (RNF38, Accession NM\_022781) is another VGAM1652 host target gene. RNF38 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RNF38, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of RNF38 BINDING SITE, designated SEQ ID:23060, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55909] Another function of VGAM1652 is therefore inhibition of Ring Finger Protein 38 (RNF38, Accession NM\_022781). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF38. Ring Finger Protein (C3HC4 type) 8 (RNF8, Accession NM\_003958) is another VGAM1652 host target gene. RNF8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNF8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNF8 BINDING SITE, designated SEQ ID:10101, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55910] Another function of VGAM1652 is therefore inhibition of Ring Finger Protein (C3HC4 type) 8 (RNF8, Accession NM\_003958). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical

cal conditions associated with RNF8. RNA-binding Region (RNP1, RRM) Containing 2 (RNPC2, Accession NM\_004902) is another VGAM1652 host target gene. RNPC2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNPC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNPC2 BINDING SITE, designated SEQ ID:11336, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55911] Another function of VGAM1652 is therefore inhibition of RNA-binding Region (RNP1, RRM) Containing 2 (RNPC2, Accession NM\_004902). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNPC2. SARM (Accession NM\_015077) is another VGAM1652 host target gene. SARM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SARM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SARM BINDING SITE, designated SEQ

ID:17460, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55912] Another function of VGAM1652 is therefore inhibition of SARM (Accession NM\_015077). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SARM. SEC10-like 1 (*S. cerevisiae*) (SEC10L1, Accession NM\_006544) is another VGAM1652 host target gene. SEC10L1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SEC10L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEC10L1 BINDING SITE, designated SEQ ID:13298, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55913] Another function of VGAM1652 is therefore inhibition of SEC10-like 1 (*S. cerevisiae*) (SEC10L1, Accession NM\_006544). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEC10L1. SWI/SNF Related,

Matrix Associated, Actin Dependent Regulator of Chromatin, Subfamily F, Member 1 (SMARCF1, Accession NM\_006015) is another VGAM1652 host target gene. SMARCF1 BINDING SITE1 through SMARCF1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SMARCF1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMARCF1 BINDING SITE1 through SMARCF1 BINDING SITE3, designated SEQ ID:12626, SEQ ID:20521 and SEQ ID:29164 respectively, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55914] Another function of VGAM1652 is therefore inhibition of SWI/SNF Related, Matrix Associated, Actin Dependent Regulator of Chromatin, Subfamily F, Member 1 (SMARCF1, Accession NM\_006015). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMARCF1. T-box 4 (TBX4, Accession NM\_018488) is another VGAM1652 host target gene. TBX4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by TBX4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TBX4 BINDING SITE, designated SEQ ID:20545, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55915] Another function of VGAM1652 is therefore inhibition of T-box 4 (TBX4, Accession NM\_018488). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBX4. ZFP106 (Accession NM\_022473) is another VGAM1652 host target gene. ZFP106 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZFP106, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZFP106 BINDING SITE, designated SEQ ID:22831, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55916] Another function of VGAM1652 is therefore inhibition of ZFP106 (Accession NM\_022473). Accordingly, utilities of

VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFP106. LOC112868 (Accession XM\_053402) is another VGAM1652 host target gene. LOC112868 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC112868, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC112868 BINDING SITE, designated SEQ ID:36082, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55917] Another function of VGAM1652 is therefore inhibition of LOC112868 (Accession XM\_053402). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC112868. LOC124842 (Accession XM\_064333) is another VGAM1652 host target gene. LOC124842 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC124842, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC124842 BINDING SITE, designated SEQ ID:37263, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55918] Another function of VGAM1652 is therefore inhibition of LOC124842 (Accession XM\_064333). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124842. LOC126302 (Accession XM\_059020) is another VGAM1652 host target gene. LOC126302 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC126302, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126302 BINDING SITE, designated SEQ ID:36823, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55919] Another function of VGAM1652 is therefore inhibition of LOC126302 (Accession XM\_059020). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126302. LOC126661 (Accession XM\_059061) is another VGAM1652 host target gene. LOC126661 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC126661, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126661 BINDING SITE, designated SEQ ID:36854, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55920] Another function of VGAM1652 is therefore inhibition of LOC126661 (Accession XM\_059061). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126661. LOC130355 (Accession XM\_059423) is another VGAM1652 host target gene. LOC130355 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC130355, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130355 BINDING SITE, designated SEQ ID:36989, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55921] Another function of VGAM1652 is therefore inhibition of

LOC130355 (Accession XM\_059423). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130355. LOC130752 (Accession XM\_059468) is another VGAM1652 host target gene. LOC130752 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC130752, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130752 BINDING SITE, designated SEQ ID:37006, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55922] Another function of VGAM1652 is therefore inhibition of LOC130752 (Accession XM\_059468). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130752. LOC144501 (Accession XM\_096612) is another VGAM1652 host target gene. LOC144501 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144501, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC144501 BINDING SITE, designated SEQ ID:40423, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55923] Another function of VGAM1652 is therefore inhibition of LOC144501 (Accession XM\_096612). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144501. LOC145988 (Accession XM\_085290) is another VGAM1652 host target gene. LOC145988 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145988, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145988 BINDING SITE, designated SEQ ID:38039, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55924] Another function of VGAM1652 is therefore inhibition of LOC145988 (Accession XM\_085290). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145988. LOC149603 (Accession XM\_047499) is an-

other VGAM1652 host target gene. LOC149603 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149603, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149603 BINDING SITE, designated SEQ ID:34970, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55925] Another function of VGAM1652 is therefore inhibition of LOC149603 (Accession XM\_047499). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149603. LOC149619 (Accession XM\_097690) is another VGAM1652 host target gene. LOC149619 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149619, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149619 BINDING SITE, designated SEQ ID:41028, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55926] Another function of VGAM1652 is therefore inhibition of LOC149619 (Accession XM\_097690). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149619. LOC150819 (Accession XM\_097954) is another VGAM1652 host target gene. LOC150819 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150819, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150819 BINDING SITE, designated SEQ ID:41247, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55927] Another function of VGAM1652 is therefore inhibition of LOC150819 (Accession XM\_097954). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150819. LOC151521 (Accession XM\_098076) is another VGAM1652 host target gene. LOC151521 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151521, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151521 BINDING SITE, designated SEQ ID:41369, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55928] Another function of VGAM1652 is therefore inhibition of LOC151521 (Accession XM\_098076). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151521. LOC152765 (Accession XM\_087519) is another VGAM1652 host target gene. LOC152765 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152765, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152765 BINDING SITE, designated SEQ ID:39316, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55929] Another function of VGAM1652 is therefore inhibition of LOC152765 (Accession XM\_087519). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC152765. LOC152925 (Accession XM\_087559) is another VGAM1652 host target gene. LOC152925 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152925, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152925 BINDING SITE, designated SEQ ID:39332, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55930] Another function of VGAM1652 is therefore inhibition of LOC152925 (Accession XM\_087559). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152925. LOC204301 (Accession XM\_115306) is another VGAM1652 host target gene. LOC204301 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC204301, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC204301 BINDING SITE, designated SEQ ID:43093, to the nucleotide sequence of VGAM1652 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4363.

[55931] Another function of VGAM1652 is therefore inhibition of LOC204301 (Accession XM\_115306). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC204301. LOC205313 (Accession XM\_119628) is another VGAM1652 host target gene. LOC205313 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC205313, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC205313 BINDING SITE, designated SEQ ID:43594, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55932] Another function of VGAM1652 is therefore inhibition of LOC205313 (Accession XM\_119628). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC205313. LOC221751 (Accession XM\_166370) is another VGAM1652 host target gene. LOC221751 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221751, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221751 BINDING SITE, designated SEQ ID:44192, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55933] Another function of VGAM1652 is therefore inhibition of LOC221751 (Accession XM\_166370). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221751. LOC253350 (Accession XM\_174261) is another VGAM1652 host target gene. LOC253350 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253350, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253350 BINDING SITE, designated SEQ ID:46587, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55934] Another function of VGAM1652 is therefore inhibition of LOC253350 (Accession XM\_174261). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC253350. LOC253981 (Accession XM\_171064) is another VGAM1652 host target gene. LOC253981 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253981, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253981 BINDING SITE, designated SEQ ID:45863, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55935] Another function of VGAM1652 is therefore inhibition of LOC253981 (Accession XM\_171064). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253981. LOC254358 (Accession XM\_170771) is another VGAM1652 host target gene. LOC254358 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254358, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254358 BINDING SITE, designated SEQ ID:45531, to

the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55936] Another function of VGAM1652 is therefore inhibition of LOC254358 (Accession XM\_170771). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254358. LOC257476 (Accession XM\_028610) is another VGAM1652 host target gene. LOC257476 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257476, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257476 BINDING SITE, designated SEQ ID:30714, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55937] Another function of VGAM1652 is therefore inhibition of LOC257476 (Accession XM\_028610). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257476. LOC64102 (Accession NM\_022144) is another VGAM1652 host target gene. LOC64102 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC64102, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC64102 BINDING SITE, designated SEQ ID:22708, to the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, also designated SEQ ID:4363.

[55938] Another function of VGAM1652 is therefore inhibition of LOC64102 (Accession NM\_022144). Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC64102. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1653 (VGAM1653) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[55939] VGAM1653 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1653 was detected is described hereinabove with reference to Figs. 1-8.

[55940] VGAM1653 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Yellow Fever Virus.

VGAM1653 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[55941] VGAM1653 gene encodes a VGAM1653 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1653 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1653 precursor RNA is designated SEQ ID:1639, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1639 is located at position 2036 relative to the genome of Yellow Fever Virus.

[55942] VGAM1653 precursor RNA folds onto itself, forming VGAM1653 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[55943] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1653 folded precursor RNA into VGAM1653 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1653 RNA is designated SEQ ID:4364, and is provided hereinbelow with reference to the sequence listing part.

[55944] VGAM1653 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1653 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1653 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[55945] VGAM1653 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1653 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1653 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1653 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1653 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[55946] The complementary binding of VGAM1653 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1653 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1653

host target RNA into VGAM1653 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[55947] It is appreciated that VGAM1653 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1653 host target genes. The mRNA of each one of this plurality of VGAM1653 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1653 RNA, herein designated VGAM RNA, and which when bound by VGAM1653 RNA causes inhibition of translation of respective one or more VGAM1653 host target proteins.

[55948] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1653 gene, herein designated VGAM GENE, on one or more VGAM1653 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[55949] It is yet further appreciated that a function of VGAM1653 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1653 include diagnosis, prevention and treatment of viral infection by Yellow Fever Virus. Specific functions, and accordingly utilities, of VGAM1653 correlate with, and may be deduced from, the identity of the host target genes which VGAM1653 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[55950] Nucleotide sequences of the VGAM1653 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1653 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1653 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1653 are further

described hereinbelow with reference to Table 1.

[55951] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1653 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1653 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[55952] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1653 gene, herein designated VGAM is inhibition of expression of VGAM1653 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1653 correlate with, and may be deduced from, the identity of the target genes which VGAM1653 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[55953] Inositol Hexaphosphate Kinase 3 (IHPK3, Accession NM\_054111) is a VGAM1653 host target gene. IHPK3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IHPK3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

IHPK3 BINDING SITE, designated SEQ ID:27653, to the nucleotide sequence of VGAM1653 RNA, herein designated VGAM RNA, also designated SEQ ID:4364.

[55954] A function of VGAM1653 is therefore inhibition of Inositol Hexaphosphate Kinase 3 (IHPK3, Accession NM\_054111). Accordingly, utilities of VGAM1653 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IHPK3. Retinal Degeneration, Slow (retinitis pigmentosa 7) (RDS, Accession NM\_000322) is another VGAM1653 host target gene. RDS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RDS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RDS BINDING SITE, designated SEQ ID:5862, to the nucleotide sequence of VGAM1653 RNA, herein designated VGAM RNA, also designated SEQ ID:4364.

[55955] Another function of VGAM1653 is therefore inhibition of Retinal Degeneration, Slow (retinitis pigmentosa 7) (RDS, Accession NM\_000322), a gene which may function as an adhesion molecule involved in stabilization and compaction of outer segment disks or in the maintenance of

the curvature of the rim. Accordingly, utilities of VGAM1653 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RDS. The function of RDS and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM341. Ubiquitin-conjugating Enzyme E2 Variant 1 (UBE2V1, Accession NM\_003349) is another VGAM1653 host target gene. UBE2V1 BINDING SITE1 through UBE2V1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by UBE2V1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBE2V1 BINDING SITE1 through UBE2V1 BINDING SITE3, designated SEQ ID:9369, SEQ ID:22521 and SEQ ID:22768 respectively, to the nucleotide sequence of VGAM1653 RNA, herein designated VGAM RNA, also designated SEQ ID:4364.

[55956] Another function of VGAM1653 is therefore inhibition of Ubiquitin-conjugating Enzyme E2 Variant 1 (UBE2V1, Accession NM\_003349), a gene which may play a role in signaling for DNA repair. Accordingly, utilities of VGAM1653

include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE2V1. The function of UBE2V1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM155.FLJ12903 (Accession NM\_022753) is another VGAM1653 host target gene. FLJ12903 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12903, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12903 BINDING SITE, designated SEQ ID:22977, to the nucleotide sequence of VGAM1653 RNA, herein designated VGAM RNA, also designated SEQ ID:4364.

[55957] Another function of VGAM1653 is therefore inhibition of FLJ12903 (Accession NM\_022753). Accordingly, utilities of VGAM1653 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12903. KIAA0285 (Accession NM\_014807) is another VGAM1653 host target gene. KIAA0285 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0285, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0285 BINDING SITE, designated SEQ ID:16750, to the nucleotide sequence of VGAM1653 RNA, herein designated VGAM RNA, also designated SEQ ID:4364.

[55958] Another function of VGAM1653 is therefore inhibition of KIAA0285 (Accession NM\_014807). Accordingly, utilities of VGAM1653 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0285. KIAA0446 (Accession XM\_044155) is another VGAM1653 host target gene. KIAA0446 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0446, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0446 BINDING SITE, designated SEQ ID:34149, to the nucleotide sequence of VGAM1653 RNA, herein designated VGAM RNA, also designated SEQ ID:4364.

[55959] Another function of VGAM1653 is therefore inhibition of KIAA0446 (Accession XM\_044155). Accordingly, utilities of VGAM1653 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA0446. KIAA0630 (Accession XM\_114729) is another VGAM1653 host target gene. KIAA0630 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0630, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0630 BINDING SITE, designated SEQ ID:43061, to the nucleotide sequence of VGAM1653 RNA, herein designated VGAM RNA, also designated SEQ ID:4364.

[55960] Another function of VGAM1653 is therefore inhibition of KIAA0630 (Accession XM\_114729). Accordingly, utilities of VGAM1653 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0630. KIAA0945 (Accession NM\_014952) is another VGAM1653 host target gene. KIAA0945 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0945, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0945 BINDING SITE, designated SEQ ID:17291, to the

nucleotide sequence of VGAM1653 RNA, herein designated VGAM RNA, also designated SEQ ID:4364.

[55961] Another function of VGAM1653 is therefore inhibition of KIAA0945 (Accession NM\_014952). Accordingly, utilities of VGAM1653 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0945. SUN1 (Accession NM\_025154) is another VGAM1653 host target gene. SUN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SUN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SUN1 BINDING SITE, designated SEQ ID:24793, to the nucleotide sequence of VGAM1653 RNA, herein designated VGAM RNA, also designated SEQ ID:4364.

[55962] Another function of VGAM1653 is therefore inhibition of SUN1 (Accession NM\_025154). Accordingly, utilities of VGAM1653 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SUN1. LOC154881 (Accession XM\_088063) is another VGAM1653 host target gene. LOC154881 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by LOC154881, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154881 BINDING SITE, designated SEQ ID:39494, to the nucleotide sequence of VGAM1653 RNA, herein designated VGAM RNA, also designated SEQ ID:4364.

[55963] Another function of VGAM1653 is therefore inhibition of LOC154881 (Accession XM\_088063). Accordingly, utilities of VGAM1653 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154881. LOC254122 (Accession XM\_170660) is another VGAM1653 host target gene. LOC254122 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254122, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254122 BINDING SITE, designated SEQ ID:45435, to the nucleotide sequence of VGAM1653 RNA, herein designated VGAM RNA, also designated SEQ ID:4364.

[55964] Another function of VGAM1653 is therefore inhibition of LOC254122 (Accession XM\_170660). Accordingly, utilities

of VGAM1653 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254122. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1654 (VGAM1654) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[55965] VGAM1654 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1654 was detected is described hereinabove with reference to Figs. 1-8.

[55966] VGAM1654 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Yellow Fever Virus. VGAM1654 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[55967] VGAM1654 gene encodes a VGAM1654 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1654 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM1654 precursor RNA is designated SEQ ID:1640, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1640 is located at position 6577 relative to the genome of Yellow Fever Virus.

- [55968] VGAM1654 precursor RNA folds onto itself, forming VGAM1654 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [55969] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1654 folded precursor RNA into VGAM1654 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1654 RNA is designated SEQ ID:4365, and

is provided hereinbelow with reference to the sequence listing part.

[55970] VGAM1654 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1654 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1654 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[55971] VGAM1654 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1654 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1654 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM1654 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1654 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[55972] The complementary binding of VGAM1654 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1654 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1654 host target RNA into VGAM1654 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[55973] It is appreciated that VGAM1654 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1654 host target genes. The mRNA of each one of this plurality of VGAM1654 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1654 RNA, herein designated VGAM RNA, and which when bound by VGAM1654 RNA causes inhibition of translation of respective one or more VGAM1654 host target proteins.

[55974] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1654 gene, herein designated VGAM GENE, on one or more VGAM1654 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[55975] It is yet further appreciated that a function of VGAM1654 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1654 include diagnosis, prevention and treatment of viral infection by Yellow Fever Virus. Specific functions, and accordingly utilities, of VGAM1654 correlate with, and may be deduced from, the identity of the host target genes which VGAM1654 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[55976] Nucleotide sequences of the VGAM1654 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1654 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1654 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1654 are further described hereinbelow with reference to Table 1.

[55977] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1654 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1654 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[55978] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM1654 gene, herein designated VGAM is inhibition of expression of VGAM1654 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1654 correlate with, and may be deduced from, the identity of the target genes which VGAM1654 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[55979] Desmocollin 2 (DSC2, Accession NM\_004949) is a VGAM1654 host target gene. DSC2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DSC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DSC2 BINDING SITE, designated SEQ ID:11393, to the nucleotide sequence of VGAM1654 RNA, herein designated VGAM RNA, also designated SEQ ID:4365.

[55980] A function of VGAM1654 is therefore inhibition of Desmocollin 2 (DSC2, Accession NM\_004949), a gene which is a component of intercellular desmosome junctions. Accordingly, utilities of VGAM1654 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DSC2. The function of DSC2 and its association

with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM909. Ring Finger Protein 14 (RNF14, Accession NM\_004290) is another VGAM1654 host target gene. RNF14 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNF14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNF14 BINDING SITE, designated SEQ ID:10505, to the nucleotide sequence of VGAM1654 RNA, herein designated VGAM RNA, also designated SEQ ID:4365.

[55981] Another function of VGAM1654 is therefore inhibition of Ring Finger Protein 14 (RNF14, Accession NM\_004290), a gene which associates with the androgen receptor (AR); functions as a transcriptional coactivator. Accordingly, utilities of VGAM1654 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF14. The function of RNF14 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM827. Cat Eye Syndrome Chromo-

some Region, Candidate 1 (CECR1, Accession NM\_017424) is another VGAM1654 host target gene. CECR1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CECR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CECR1 BINDING SITE, designated SEQ ID:18886, to the nucleotide sequence of VGAM1654 RNA, herein designated VGAM RNA, also designated SEQ ID:4365.

[55982] Another function of VGAM1654 is therefore inhibition of Cat Eye Syndrome Chromosome Region, Candidate 1 (CECR1, Accession NM\_017424). Accordingly, utilities of VGAM1654 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CECR1. KIAA1877 (Accession XM\_038616) is another VGAM1654 host target gene. KIAA1877 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1877, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1877 BINDING SITE,

designated SEQ ID:32887, to the nucleotide sequence of VGAM1654 RNA, herein designated VGAM RNA, also designated SEQ ID:4365.

[55983] Another function of VGAM1654 is therefore inhibition of KIAA1877 (Accession XM\_038616). Accordingly, utilities of VGAM1654 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1877. LOC254848 (Accession XM\_173133) is another VGAM1654 host target gene. LOC254848 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254848, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254848 BINDING SITE, designated SEQ ID:46380, to the nucleotide sequence of VGAM1654 RNA, herein designated VGAM RNA, also designated SEQ ID:4365.

[55984] Another function of VGAM1654 is therefore inhibition of LOC254848 (Accession XM\_173133). Accordingly, utilities of VGAM1654 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254848. LOC255308 (Accession XM\_170536) is another VGAM1654 host target gene. LOC255308 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255308, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255308 BINDING SITE, designated SEQ ID:45356, to the nucleotide sequence of VGAM1654 RNA, herein designated VGAM RNA, also designated SEQ ID:4365.

[55985] Another function of VGAM1654 is therefore inhibition of LOC255308 (Accession XM\_170536). Accordingly, utilities of VGAM1654 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255308. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1655 (VGAM1655) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[55986] VGAM1655 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1655 was detected is described hereinabove with reference to Figs. 1-8.

[55987] VGAM1655 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Yellow Fever Virus.

VGAM1655 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[55988] VGAM1655 gene encodes a VGAM1655 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1655 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1655 precursor RNA is designated SEQ ID:1641, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1641 is located at position 1472 relative to the genome of Yellow Fever Virus.

[55989] VGAM1655 precursor RNA folds onto itself, forming VGAM1655 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[55990] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1655 folded precursor RNA into VGAM1655 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1655 RNA is designated SEQ ID:4366, and is provided hereinbelow with reference to the sequence listing part.

[55991] VGAM1655 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1655 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1655 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[55992] VGAM1655 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1655 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1655 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1655 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1655 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[55993] The complementary binding of VGAM1655 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1655 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1655 host target RNA into VGAM1655 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[55994] It is appreciated that VGAM1655 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1655 host target genes. The mRNA of each one of this plurality of VGAM1655 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1655 RNA, herein designated VGAM RNA, and which when bound by VGAM1655 RNA causes inhibition of translation of respective one or more VGAM1655 host target proteins.

[55995] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1655 gene, herein designated VGAM GENE, on one or more VGAM1655 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[55996] It is yet further appreciated that a function of VGAM1655 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1655 include diagnosis, prevention and treatment of viral infection by Yellow Fever Virus. Specific functions, and accordingly utilities, of VGAM1655 correlate with, and may be deduced from, the identity of the host target genes which VGAM1655 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[55997] Nucleotide sequences of the VGAM1655 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1655 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1655 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1655 are further described hereinbelow with reference to Table 1.

[55998] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1655 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1655 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[55999] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1655 gene, herein designated VGAM is inhibition of expression of VGAM1655 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1655 correlate with, and may be deduced from, the identity of the target genes which VGAM1655 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[56000] FLJ12443 (Accession NM\_024830) is a VGAM1655 host target gene. FLJ12443 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12443, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of FLJ12443 BINDING SITE, designated SEQ ID:24224, to the nucleotide sequence of VGAM1655 RNA, herein designated VGAM RNA, also designated SEQ ID:4366.

[56001] A function of VGAM1655 is therefore inhibition of FLJ12443 (Accession NM\_024830). Accordingly, utilities of VGAM1655 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12443. KIAA0478 (Accession NM\_014870) is another VGAM1655 host target gene. KIAA0478 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0478, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0478 BINDING SITE, designated SEQ ID:16980, to the nucleotide sequence of VGAM1655 RNA, herein designated VGAM RNA, also designated SEQ ID:4366.

[56002] Another function of VGAM1655 is therefore inhibition of KIAA0478 (Accession NM\_014870). Accordingly, utilities of VGAM1655 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0478. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1656 (VGAM1656) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[56003] VGAM1656 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1656 was detected is described hereinabove with reference to Figs. 1–8.

[56004] VGAM1656 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Molluscum Contagiosum Virus. VGAM1656 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[56005] VGAM1656 gene encodes a VGAM1656 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1656 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1656 precursor RNA is designated SEQ ID:1642, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:1642 is located at position 8730 relative to the genome of Molluscum Contagiosum Virus.

[56006] VGAM1656 precursor RNA folds onto itself, forming VGAM1656 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[56007] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1656 folded precursor RNA into VGAM1656 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1656 RNA is designated SEQ ID:4367, and is provided hereinbelow with reference to the sequence listing part.

[56008] VGAM1656 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1656 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1656 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[56009] VGAM1656 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1656 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1656 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1656 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1656 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[56010] The complementary binding of VGAM1656 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1656 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1656 host target RNA into VGAM1656 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[56011] It is appreciated that VGAM1656 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1656 host target genes. The mRNA of each one of this plurality of VGAM1656 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1656 RNA, herein designated VGAM RNA, and which when bound by VGAM1656 RNA causes inhibition of translation of respective one or more

VGAM1656 host target proteins.

[56012] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1656 gene, herein designated VGAM GENE, on one or more VGAM1656 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[56013] It is yet further appreciated that a function of VGAM1656 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1656 include diagnosis, prevention and treatment of viral infection by Molluscum Contagiosum

Virus. Specific functions, and accordingly utilities, of VGAM1656 correlate with, and may be deduced from, the identity of the host target genes which VGAM1656 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[56014] Nucleotide sequences of the VGAM1656 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1656 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1656 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1656 are further described hereinbelow with reference to Table 1.

[56015] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1656 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1656 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[56016] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1656 gene, herein designated VGAM is inhibition of expression of VGAM1656 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM1656 correlate with, and may be deduced from, the identity of the target genes which VGAM1656 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[56017] Diacylglycerol Kinase, Iota (DGKI, Accession NM\_004717) is a VGAM1656 host target gene. DGKI BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DGKI, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DGKI BINDING SITE, designated SEQ ID:11079, to the nucleotide sequence of VGAM1656 RNA, herein designated VGAM RNA, also designated SEQ ID:4367.

[56018] A function of VGAM1656 is therefore inhibition of Diacylglycerol Kinase, Iota (DGKI, Accession NM\_004717), a gene which regulates the intracellular concentration of the second messenger diacylglycerol (DAG). Accordingly, utilities of VGAM1656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DGKI. The function of DGKI and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with

reference to VGAM1107. Hyperpolarization Activated Cyclic Nucleotide-gated Potassium Channel 2 (HCN2, Accession NM\_001194) is another VGAM1656 host target gene. HCN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HCN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HCN2 BINDING SITE, designated SEQ ID:6863, to the nucleotide sequence of VGAM1656 RNA, herein designated VGAM RNA, also designated SEQ ID:4367.

[56019] Another function of VGAM1656 is therefore inhibition of Hyperpolarization Activated Cyclic Nucleotide-gated Potassium Channel 2 (HCN2, Accession NM\_001194), a gene which is hyperpolarization-activated cyclic nucleotide-gated cation channel 2 and may act as a pacemaker channel in the brain and the heart. Accordingly, utilities of VGAM1656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HCN2. The function of HCN2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1189. Leukemia Inhibitory Factor Re-

ceptor (LIFR, Accession NM\_002310) is another VGAM1656 host target gene. LIFR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LIFR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIFR BINDING SITE, designated SEQ ID:8103, to the nucleotide sequence of VGAM1656 RNA, herein designated VGAM RNA, also designated SEQ ID:4367.

[56020] Another function of VGAM1656 is therefore inhibition of Leukemia Inhibitory Factor Receptor (LIFR, Accession NM\_002310). Accordingly, utilities of VGAM1656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIFR. Solute Carrier Family 9 (sodium/hydrogen exchanger), Isoform 1 (antiporter, Na<sup>+</sup>/H<sup>+</sup>, amiloride sensitive) (SLC9A1, Accession XM\_046881) is another VGAM1656 host target gene. SLC9A1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SLC9A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of SLC9A1 BINDING SITE, designated SEQ ID:34858, to the nucleotide sequence of VGAM1656 RNA, herein designated VGAM RNA, also designated SEQ ID:4367.

[56021] Another function of VGAM1656 is therefore inhibition of Solute Carrier Family 9 (sodium/hydrogen exchanger), Isoform 1 (antiporter, Na<sup>+</sup>/H<sup>+</sup>, amiloride sensitive) (SLC9A1, Accession XM\_046881), a gene which is involved in pH regulation to eliminate acids generated by active metabolism or to counter adverse environmental conditions. Accordingly, utilities of VGAM1656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC9A1. The function of SLC9A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM206. SMAC (Accession NM\_138930) is another VGAM1656 host target gene. SMAC BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SMAC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMAC BINDING SITE, designated SEQ ID:29050,

to the nucleotide sequence of VGAM1656 RNA, herein designated VGAM RNA, also designated SEQ ID:4367.

[56022] Another function of VGAM1656 is therefore inhibition of SMAC (Accession NM\_138930), a gene which promotes apoptosis via caspase activation. Accordingly, utilities of VGAM1656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMAC. The function of SMAC and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74. Tumor Suppressing Subtransferable Candidate 4 (TSSC4, Accession NM\_005706) is another VGAM1656 host target gene. TSSC4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TSSC4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TSSC4 BINDING SITE, designated SEQ ID:12259, to the nucleotide sequence of VGAM1656 RNA, herein designated VGAM RNA, also designated SEQ ID:4367.

[56023] Another function of VGAM1656 is therefore inhibition of Tumor Suppressing Subtransferable Candidate 4 (TSSC4,

Accession NM\_005706), a gene which is of unknown function. Accordingly, utilities of VGAM1656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TSSC4. The function of TSSC4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1233. WNT1 Inducible Signaling Pathway Protein 1 (WISP1, Accession NM\_003882) is another VGAM1656 host target gene. WISP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by WISP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WISP1 BINDING SITE, designated SEQ ID:9962, to the nucleotide sequence of VGAM1656 RNA, herein designated VGAM RNA, also designated SEQ ID:4367.

[56024] Another function of VGAM1656 is therefore inhibition of WNT1 Inducible Signaling Pathway Protein 1 (WISP1, Accession NM\_003882), a gene which is a member of connective tissue growth factor family. Accordingly, utilities of VGAM1656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

WISP1. The function of WISP1 has been established by previous studies. WNT1 (OMIM Ref. No. 164820) is a member of a family of cysteine-rich, glycosylated signaling proteins that mediate diverse developmental processes such as the control of cell proliferation, adhesion, cell polarity, and the establishment of cell fates. This family has been referred to as CCN, for connective tissue growth factor, cysteine-rich-61, neuroblastoma overexpressed. Wnt1 was identified as an oncogene activated by the insertion of mouse mammary tumor virus in virus-induced mammary adenocarcinomas. Although Wnt1 is not expressed in the normal mammary gland, expression of Wnt1 in transgenic mice causes mammary tumors. To identify downstream genes in the WNT signaling pathway that are relevant to the transformed cell phenotype, Pennica et al. (1998) used a PCR-based cDNA subtraction strategy, suppression subtractive hybridization. Pennica et al. (1998) reported the identification of 2 genes, WISP1 and WISP2 (OMIM Ref. No. 603399), that are upregulated in the mouse mammary epithelial cell line transformed by Wnt1, but not by Wnt4 (OMIM Ref. No. 603490). Together with a third related gene, WISP3 (OMIM Ref. No. 603399), these proteins define a subfamily of the

connective tissue growth factor family. Two distinct systems demonstrated WISP induction to be associated with the expression of WNT1. WISP1 genomic DNA was amplified in colon cancer cell lines and in human colon tumors and its RNA overexpressed in 84% of the tumors examined compared with patient-matched normal mucosa. WISP3 also was overexpressed in 63% of colon tumors analyzed. In contrast, WISP2 showed reduced RNA expression in 79% of the tumors. These results suggested that WISP genes may be downstream of WNT1 signaling and that aberrant levels of WISP expression in colon cancer may play a role in colon tumorigenesis. Pennica et al. (1998) found that the WISP1 cDNA encodes a 367-amino acid protein. Mouse and human WISP1 proteins are 84% identical; both have hydrophobic N-terminal signal sequences, 38 conserved cysteine residues, and 4 potential N-linked glycosylation sites. Alignment of the 3 human WISP proteins showed that WISP1 and WISP3 are most similar (42%), whereas WISP2 had 37% identity with WISP1 and 32% identity with WISP3. Tanaka et al. (2001) used targeted differential displays to identify a novel variant of WISP1, designated WISP1v, which was overexpressed in scirrhous gastric carcinomas. The predicted protein of the

variant WISP1 completely lacks a module of von Willebrand factor type C (see OMIM Ref. No. 193400) that is thought to participate in protein complex formation. Ectopic expression of the variant showed it to be a secreted oncoprotein inducing a striking cellular transformation and rapid piling-up growth. The authors noted that WISP1 transfectants enhanced the invasive phenotype of cocultured gastric carcinoma cells, while wildtype WISP1 had no such potential. By use of radiation hybrid mapping panels, Pennica et al. (1998) mapped the 3 WISP genes. WISP1 was mapped to 8q24.1–q24.3, roughly 4 Mb distal to MYC (OMIM Ref. No. 190080). WISP2 was mapped to 20q12–q13.1, and WISP3 to 6q22–q23.

[56025] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[56026] Pennica, D.; Swanson, T. A.; Welsh, J. W.; Roy, M. A.; Lawrence, D. A.; Lee, J.; Brush, J.; Taneyhill, L. A.; Deuel, B.; Lew, M.; Watanabe, C.; Cohen, R. L.; Melhem, M. F.; Finley, G. G.; Quirke, P.; Goddard, A. D.; Hillan, K. J.; Gurney, A. L.; Botstein, D.; Levine, A. J. : WISP genes are members of the connective tissue growth factor family that are up-regulated in Wnt-1-transformed cells and

aberrantly expressed in human colon tumors. Proc. Nat. Acad. Sci. 95: 14717–14722, 1998. ; and

[56027] Tanaka, S.; Sugimachi, K.; Saeki, H.; Kinoshita, J.; Ohga, T.; Shimada, M.; Maehara, Y.; Sugimachi, K. : A novel variant of WISP1 lacking a von Willebrand type C module overexpressed in.

[56028] Further studies establishing the function and utilities of WISP1 are found in John Hopkins OMIM database record ID 603398, and in cited publications numbered 7621–7622 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chromosome 22 Open Reading Frame 2 (C22orf2, Accession XM\_170492) is another VGAM1656 host target gene. C22orf2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C22orf2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C22orf2 BINDING SITE, designated SEQ ID:45334, to the nucleotide sequence of VGAM1656 RNA, herein designated VGAM RNA, also designated SEQ ID:4367.

[56029] Another function of VGAM1656 is therefore inhibition of Chromosome 22 Open Reading Frame 2 (C22orf2, Acces-

sion XM\_170492). Accordingly, utilities of VGAM1656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C22orf2. FLJ00001 (Accession XM\_088525) is another VGAM1656 host target gene. FLJ00001 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ00001, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ00001 BINDING SITE, designated SEQ ID:39775, to the nucleotide sequence of VGAM1656 RNA, herein designated VGAM RNA, also designated SEQ ID:4367.

[56030] Another function of VGAM1656 is therefore inhibition of FLJ00001 (Accession XM\_088525). Accordingly, utilities of VGAM1656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00001. FLJ22037 (Accession XM\_168215) is another VGAM1656 host target gene. FLJ22037 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ22037, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of FLJ22037 BINDING SITE, designated SEQ ID:45075, to the nucleotide sequence of VGAM1656 RNA, herein designated VGAM RNA, also designated SEQ ID:4367.

[56031] Another function of VGAM1656 is therefore inhibition of FLJ22037 (Accession XM\_168215). Accordingly, utilities of VGAM1656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22037. Potassium Channel, Subfamily T, Member 1 (KCNT1, Accession XM\_029962) is another VGAM1656 host target gene. KCNT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KCNT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNT1 BINDING SITE, designated SEQ ID:30977, to the nucleotide sequence of VGAM1656 RNA, herein designated VGAM RNA, also designated SEQ ID:4367.

[56032] Another function of VGAM1656 is therefore inhibition of Potassium Channel, Subfamily T, Member 1 (KCNT1, Accession XM\_029962). Accordingly, utilities of VGAM1656 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with KCNT1. MDS018 (Accession NM\_021823) is another VGAM1656 host target gene. MDS018 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MDS018, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MDS018 BINDING SITE, designated SEQ ID:22401, to the nucleotide sequence of VGAM1656 RNA, herein designated VGAM RNA, also designated SEQ ID:4367.

[56033] Another function of VGAM1656 is therefore inhibition of MDS018 (Accession NM\_021823). Accordingly, utilities of VGAM1656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MDS018. Syndecan 3 (N-syndecan) (SDC3, Accession NM\_014654) is another VGAM1656 host target gene. SDC3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SDC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDC3 BINDING SITE, designated SEQ ID:16083,

to the nucleotide sequence of VGAM1656 RNA, herein designated VGAM RNA, also designated SEQ ID:4367.

[56034] Another function of VGAM1656 is therefore inhibition of Syndecan 3 (N-syndecan) (SDC3, Accession NM\_014654). Accordingly, utilities of VGAM1656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDC3. LOC126353 (Accession XM\_059034) is another VGAM1656 host target gene. LOC126353 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC126353, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126353 BINDING SITE, designated SEQ ID:36829, to the nucleotide sequence of VGAM1656 RNA, herein designated VGAM RNA, also designated SEQ ID:4367.

[56035] Another function of VGAM1656 is therefore inhibition of LOC126353 (Accession XM\_059034). Accordingly, utilities of VGAM1656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126353. LOC128989 (Accession XM\_059310) is another VGAM1656 host target gene. LOC128989 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC128989, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC128989 BINDING SITE, designated SEQ ID:36940, to the nucleotide sequence of VGAM1656 RNA, herein designated VGAM RNA, also designated SEQ ID:4367.

[56036] Another function of VGAM1656 is therefore inhibition of LOC128989 (Accession XM\_059310). Accordingly, utilities of VGAM1656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC128989. LOC134265 (Accession XM\_059702) is another VGAM1656 host target gene. LOC134265 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC134265, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC134265 BINDING SITE, designated SEQ ID:37074, to the nucleotide sequence of VGAM1656 RNA, herein designated VGAM RNA, also designated SEQ ID:4367.

[56037] Another function of VGAM1656 is therefore inhibition of

LOC134265 (Accession XM\_059702). Accordingly, utilities of VGAM1656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC134265. LOC157349 (Accession XM\_088298) is another VGAM1656 host target gene. LOC157349 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157349, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157349 BINDING SITE, designated SEQ ID:39599, to the nucleotide sequence of VGAM1656 RNA, herein designated VGAM RNA, also designated SEQ ID:4367.

[56038] Another function of VGAM1656 is therefore inhibition of LOC157349 (Accession XM\_088298). Accordingly, utilities of VGAM1656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157349. LOC219700 (Accession XM\_167570) is another VGAM1656 host target gene. LOC219700 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC219700, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC219700 BINDING SITE, designated SEQ ID:44701, to the nucleotide sequence of VGAM1656 RNA, herein designated VGAM RNA, also designated SEQ ID:4367.

[56039] Another function of VGAM1656 is therefore inhibition of LOC219700 (Accession XM\_167570). Accordingly, utilities of VGAM1656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219700. LOC221399 (Accession XM\_168134) is another VGAM1656 host target gene. LOC221399 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221399, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221399 BINDING SITE, designated SEQ ID:45051, to the nucleotide sequence of VGAM1656 RNA, herein designated VGAM RNA, also designated SEQ ID:4367.

[56040] Another function of VGAM1656 is therefore inhibition of LOC221399 (Accession XM\_168134). Accordingly, utilities of VGAM1656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221399. LOC256158 (Accession XM\_175125) is an-

other VGAM1656 host target gene. LOC256158 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256158, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256158 BINDING SITE, designated SEQ ID:46625, to the nucleotide sequence of VGAM1656 RNA, herein designated VGAM RNA, also designated SEQ ID:4367.

[56041] Another function of VGAM1656 is therefore inhibition of LOC256158 (Accession XM\_175125). Accordingly, utilities of VGAM1656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256158. LOC51337 (Accession NM\_016647) is another VGAM1656 host target gene. LOC51337 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51337, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51337 BINDING SITE, designated SEQ ID:18765, to the nucleotide sequence of VGAM1656 RNA, herein designated VGAM RNA, also designated SEQ ID:4367.

[56042] Another function of VGAM1656 is therefore inhibition of LOC51337 (Accession NM\_016647). Accordingly, utilities of VGAM1656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51337. LOC54103 (Accession XM\_168508) is another VGAM1656 host target gene. LOC54103 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC54103, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC54103 BINDING SITE, designated SEQ ID:45208, to the nucleotide sequence of VGAM1656 RNA, herein designated VGAM RNA, also designated SEQ ID:4367.

[56043] Another function of VGAM1656 is therefore inhibition of LOC54103 (Accession XM\_168508). Accordingly, utilities of VGAM1656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC54103. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1657 (VGAM1657) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[56044] VGAM1657 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1657 was detected is described hereinabove with reference to Figs. 1-8.

[56045] VGAM1657 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mollusum Contagiosum Virus. VGAM1657 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[56046] VGAM1657 gene encodes a VGAM1657 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1657 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1657 precursor RNA is designated SEQ ID:1643, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1643 is located at position 9944 relative to the genome of Mollusum Contagiosum Virus.

[56047] VGAM1657 precursor RNA folds onto itself, forming VGAM1657 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[56048] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1657 folded precursor RNA into VGAM1657 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM1657 RNA is designated SEQ ID:4368, and is provided hereinbelow with reference to the sequence listing part.

[56049] VGAM1657 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1657 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1657 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[56050] VGAM1657 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1657 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1657 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1657 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1657 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[56051] The complementary binding of VGAM1657 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1657 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1657 host target RNA into VGAM1657 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[56052] It is appreciated that VGAM1657 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1657 host target genes. The mRNA of each one of this plurality of VGAM1657 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1657 RNA, herein designated VGAM RNA, and which when bound by VGAM1657 RNA causes inhibition of translation of respective one or more VGAM1657 host target proteins.

[56053] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1657 gene, herein designated VGAM GENE, on one or more VGAM1657 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[56054] It is yet further appreciated that a function of VGAM1657 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1657 include diagnosis, prevention and treatment of viral infection by Molluscum Contagiosum Virus. Specific functions, and accordingly utilities, of VGAM1657 correlate with, and may be deduced from, the identity of the host target genes which VGAM1657 binds and inhibits, and the function of these host target genes,

as elaborated hereinbelow.

[56055] Nucleotide sequences of the VGAM1657 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1657 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1657 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1657 are further described hereinbelow with reference to Table 1.

[56056] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1657 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1657 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[56057] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1657 gene, herein designated VGAM is inhibition of expression of VGAM1657 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1657 correlate with, and may be deduced from, the identity of the target genes which VGAM1657 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[56058] MAP/microtubule Affinity-regulating Kinase 3 (MARK3, Accession NM\_002376) is a VGAM1657 host target gene. MARK3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MARK3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MARK3 BINDING SITE, designated SEQ ID:8191, to the nucleotide sequence of VGAM1657 RNA, herein designated VGAM RNA, also designated SEQ ID:4368.

[56059] A function of VGAM1657 is therefore inhibition of MAP/ microtubule Affinity-regulating Kinase 3 (MARK3, Accession NM\_002376), a gene which may be involved in cell cycle regulation. Accordingly, utilities of VGAM1657 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MARK3. The function of MARK3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM964.FLJ21276 (Accession NM\_024633) is another VGAM1657 host target gene. FLJ21276 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by FLJ21276, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21276 BINDING SITE, designated SEQ ID:23901, to the nucleotide sequence of VGAM1657 RNA, herein designated VGAM RNA, also designated SEQ ID:4368.

[56060] Another function of VGAM1657 is therefore inhibition of FLJ21276 (Accession NM\_024633). Accordingly, utilities of VGAM1657 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21276. LOC92299 (Accession XM\_044075) is another VGAM1657 host target gene. LOC92299 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92299, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92299 BINDING SITE, designated SEQ ID:34130, to the nucleotide sequence of VGAM1657 RNA, herein designated VGAM RNA, also designated SEQ ID:4368.

[56061] Another function of VGAM1657 is therefore inhibition of LOC92299 (Accession XM\_044075). Accordingly, utilities of VGAM1657 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92299. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1658 (VGAM1658) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[56062] VGAM1658 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1658 was detected is described hereinabove with reference to Figs. 1–8.

[56063] VGAM1658 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Molluscum Contagiosum Virus. VGAM1658 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[56064] VGAM1658 gene encodes a VGAM1658 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM1658 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1658 precursor RNA is designated SEQ ID:1644, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1644 is located at position 9453 relative to the genome of Molluscum Contagiosum Virus.

[56065] VGAM1658 precursor RNA folds onto itself, forming VGAM1658 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[56066] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1658 folded precursor RNA into VGAM1658 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1658 RNA is designated SEQ ID:4369, and is provided hereinbelow with reference to the sequence listing part.

[56067] VGAM1658 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1658 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1658 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[56068] VGAM1658 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1658 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1658 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1658 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1658 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[56069] The complementary binding of VGAM1658 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1658 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1658 host target RNA into VGAM1658 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[56070] It is appreciated that VGAM1658 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1658 host target genes. The mRNA of each one of this plurality of VGAM1658 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1658 RNA, herein designated VGAM RNA, and which when bound by VGAM1658 RNA causes inhibition of translation of respective one or more VGAM1658 host target proteins.

[56071] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1658 gene, herein designated VGAM GENE, on one or more VGAM1658 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[56072] It is yet further appreciated that a function of VGAM1658 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1658 include diagnosis, prevention and treatment of viral infection by Mollusum Contagiosum Virus. Specific functions, and accordingly utilities, of VGAM1658 correlate with, and may be deduced from, the identity of the host target genes which VGAM1658 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[56073] Nucleotide sequences of the VGAM1658 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1658 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1658 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1658 are further described hereinbelow with reference to Table 1.

[56074] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1658 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1658 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[56075] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1658 gene, herein designated VGAM is inhibition of expression of VGAM1658 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1658 correlate with, and may be deduced from, the identity of the target genes which VGAM1658 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[56076] Ras Homolog Gene Family, Member C (ARHC, Accession NM\_005167) is a VGAM1658 host target gene. ARHC BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ARHC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHC BINDING SITE, designated SEQ ID:11663, to the nucleotide sequence of VGAM1658 RNA, herein designated VGAM RNA, also designated SEQ ID:4369.

[56077] A function of VGAM1658 is therefore inhibition of Ras Homolog Gene Family, Member C (ARHC, Accession NM\_005167), a gene which remodels of the actin cytoskeleton during cell morphogenesis and motility. Ac-

cordingly, utilities of VGAM1658 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHC. The function of ARHC and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM885. Histone Deacetylase 4 (HDAC4, Accession NM\_006037) is another VGAM1658 host target gene. HDAC4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HDAC4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HDAC4 BINDING SITE, designated SEQ ID:12665, to the nucleotide sequence of VGAM1658 RNA, herein designated VGAM RNA, also designated SEQ ID:4369.

[56078] Another function of VGAM1658 is therefore inhibition of Histone Deacetylase 4 (HDAC4, Accession NM\_006037), a gene which is responsible for the deacetylation of lysine residues on the n-terminal part of the core histones and may mediate transcriptional regulation. Accordingly, utilities of VGAM1658 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with HDAC4. The function of HDAC4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM264. Inducible T-cell Co-stimulator (ICOS, Accession NM\_012092) is another VGAM1658 host target gene. ICOS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ICOS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ICOS BINDING SITE, designated SEQ ID:14391, to the nucleotide sequence of VGAM1658 RNA, herein designated VGAM RNA, also designated SEQ ID:4369.

[56079] Another function of VGAM1658 is therefore inhibition of Inducible T-cell Co-stimulator (ICOS, Accession NM\_012092), a gene which forms homodimers and functions as an inducible T-cell co-stimulator. Accordingly, utilities of VGAM1658 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ICOS. The function of ICOS and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with

reference to VGAM18.LIM Domains Containing 1 (LIMD1, Accession NM\_014240) is another VGAM1658 host target gene. LIMD1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LIMD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIMD1 BINDING SITE, designated SEQ ID:15501, to the nucleotide sequence of VGAM1658 RNA, herein designated VGAM RNA, also designated SEQ ID:4369.

[56080] Another function of VGAM1658 is therefore inhibition of LIM Domains Containing 1 (LIMD1, Accession NM\_014240). Accordingly, utilities of VGAM1658 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIMD1. ASAH (Accession NM\_004315) is another VGAM1658 host target gene. ASAH BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ASAH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ASAH BINDING SITE, designated SEQ ID:10518,

to the nucleotide sequence of VGAM1658 RNA, herein designated VGAM RNA, also designated SEQ ID:4369.

[56081] Another function of VGAM1658 is therefore inhibition of ASAH (Accession NM\_004315). Accordingly, utilities of VGAM1658 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASAH. KIAA0934 (Accession XM\_034536) is another VGAM1658 host target gene. KIAA0934 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0934, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0934 BINDING SITE, designated SEQ ID:32121, to the nucleotide sequence of VGAM1658 RNA, herein designated VGAM RNA, also designated SEQ ID:4369.

[56082] Another function of VGAM1658 is therefore inhibition of KIAA0934 (Accession XM\_034536). Accordingly, utilities of VGAM1658 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0934. KIAA1904 (Accession XM\_056282) is another VGAM1658 host target gene. KIAA1904 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA1904, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1904 BINDING SITE, designated SEQ ID:36383, to the nucleotide sequence of VGAM1658 RNA, herein designated VGAM RNA, also designated SEQ ID:4369.

[56083] Another function of VGAM1658 is therefore inhibition of KIAA1904 (Accession XM\_056282). Accordingly, utilities of VGAM1658 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1904. LIP8 (Accession XM\_113928) is another VGAM1658 host target gene. LIP8 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LIP8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIP8 BINDING SITE, designated SEQ ID:42547, to the nucleotide sequence of VGAM1658 RNA, herein designated VGAM RNA, also designated SEQ ID:4369.

[56084] Another function of VGAM1658 is therefore inhibition of LIP8 (Accession XM\_113928). Accordingly, utilities of

VGAM1658 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIP8. LOC149478 (Accession XM\_086536) is another VGAM1658 host target gene. LOC149478 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149478, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149478 BINDING SITE, designated SEQ ID:38751, to the nucleotide sequence of VGAM1658 RNA, herein designated VGAM RNA, also designated SEQ ID:4369.

[56085] Another function of VGAM1658 is therefore inhibition of LOC149478 (Accession XM\_086536). Accordingly, utilities of VGAM1658 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149478. LOC196477 (Accession XM\_113728) is another VGAM1658 host target gene. LOC196477 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC196477, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC196477 BINDING SITE, designated SEQ ID:42376, to the nucleotide sequence of VGAM1658 RNA, herein designated VGAM RNA, also designated SEQ ID:4369.

[56086] Another function of VGAM1658 is therefore inhibition of LOC196477 (Accession XM\_113728). Accordingly, utilities of VGAM1658 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196477. LOC199990 (Accession XM\_114083) is another VGAM1658 host target gene. LOC199990 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199990, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199990 BINDING SITE, designated SEQ ID:42682, to the nucleotide sequence of VGAM1658 RNA, herein designated VGAM RNA, also designated SEQ ID:4369.

[56087] Another function of VGAM1658 is therefore inhibition of LOC199990 (Accession XM\_114083). Accordingly, utilities of VGAM1658 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199990. LOC245806 (Accession XM\_166309) is another VGAM1658 host target gene. LOC245806 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC245806, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC245806 BINDING SITE, designated SEQ ID:44132, to the nucleotide sequence of VGAM1658 RNA, herein designated VGAM RNA, also designated SEQ ID:4369.

[56088] Another function of VGAM1658 is therefore inhibition of LOC245806 (Accession XM\_166309). Accordingly, utilities of VGAM1658 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC245806. LOC91663 (Accession NM\_138373) is another VGAM1658 host target gene. LOC91663 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91663, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91663 BINDING SITE, designated SEQ ID:28753, to the nucleotide sequence of VGAM1658 RNA, herein designated VGAM RNA, also designated SEQ ID:4369.

[56089] Another function of VGAM1658 is therefore inhibition of

LOC91663 (Accession NM\_138373). Accordingly, utilities of VGAM1658 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91663. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1659 (VGAM1659) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[56090] VGAM1659 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1659 was detected is described hereinabove with reference to Figs. 1-8.

[56091] VGAM1659 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Molluscum Contagiosum Virus. VGAM1659 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[56092] VGAM1659 gene encodes a VGAM1659 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1659 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1659 precursor RNA is designated SEQ ID:1645, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1645 is located at position 13023 relative to the genome of Molluscum Contagiosum Virus.

[56093] VGAM1659 precursor RNA folds onto itself, forming VGAM1659 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[56094] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1659 folded precursor RNA into VGAM1659 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide se-

quence of VGAM1659 RNA is designated SEQ ID:4370, and is provided hereinbelow with reference to the sequence listing part.

[56095] VGAM1659 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1659 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1659 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[56096] VGAM1659 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1659 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1659 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM1659 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1659 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[56097] The complementary binding of VGAM1659 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1659 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1659 host target RNA into VGAM1659 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[56098] It is appreciated that VGAM1659 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1659 host target genes. The mRNA of each one of this plurality of VGAM1659 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1659 RNA, herein designated VGAM RNA, and which when bound by VGAM1659 RNA causes inhibition of translation of respective one or more VGAM1659 host target proteins.

[56099] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1659 gene, herein designated VGAM GENE, on one or more VGAM1659 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[56100] It is yet further appreciated that a function of VGAM1659

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1659 include diagnosis, prevention and treatment of viral infection by Mollusum Contagiosum Virus. Specific functions, and accordingly utilities, of VGAM1659 correlate with, and may be deduced from, the identity of the host target genes which VGAM1659 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[56101] Nucleotide sequences of the VGAM1659 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1659 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1659 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1659 are further described hereinbelow with reference to Table 1.

[56102] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1659 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1659 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[56103] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1659 gene, herein designated VGAM is inhibition of expression of VGAM1659 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1659 correlate with, and may be deduced from, the identity of the target genes which VGAM1659 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[56104] Egl Nine Homolog 2 (*C. elegans*) (EGLN2, Accession NM\_080732) is a VGAM1659 host target gene. EGLN2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EGLN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGLN2 BINDING SITE, designated SEQ ID:28021, to the nucleotide sequence of VGAM1659 RNA, herein designated VGAM RNA, also designated SEQ ID:4370.

[56105] A function of VGAM1659 is therefore inhibition of Egl Nine Homolog 2 (*C. elegans*) (EGLN2, Accession NM\_080732), a gene which is an essential component of the pathway. Accordingly, utilities of VGAM1659 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with EGLN2. The function of EGLN2 and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM432. Early Growth Response 4 (EGR4, Accession NM\_001965) is another VGAM1659 host target gene. EGR4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EGR4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGR4 BINDING SITE, designated SEQ ID:7693, to the nucleotide sequence of VGAM1659 RNA, herein designated VGAM RNA, also designated SEQ ID:4370.

[56106] Another function of VGAM1659 is therefore inhibition of Early Growth Response 4 (EGR4, Accession NM\_001965), a gene which is a Member of the early-response-gene family. Accordingly, utilities of VGAM1659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGR4. The function of EGR4 has been established by previous studies. When eukaryotic cells are stimulated to undergo mitogenesis or differentiation, the expression of a small subset of genes, termed

early response or immediate early genes, is rapidly activated. Many early response genes encode transcriptional regulators, for example, nerve growth factor-induced clones C and A, also called EGR4 and EGR1 (OMIM Ref. No. 128990), respectively. By use of fluorescence in situ hybridization, Crosby et al. (1992) localized the human EGR4 gene to 2p13. Barrow et al. (1994) demonstrated that the homologous gene in the mouse (Egr4) maps to chromosome 6 in a region of conserved homology of synteny with human chromosome 2.

[56107] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[56108] Barrow, L. L.; Simin, K.; Jones, J. M.; Lee, D. C.; Meisler, M. H. : Conserved linkage of early growth response 4, annexin 4, and transforming growth factor alpha on mouse chromosome 6. *Genomics* 19: 388–390, 1994. ; and

[56109] Crosby, S. D.; Veile, R. A.; Donis-Keller, H.; Baraban, J. M.; Bhat, R. V.; Simburger, K. S.; Milbrandt, J. : Neural-specific expression, genomic structure, and chromosomal localization.

[56110] Further studies establishing the function and utilities of EGR4 are found in John Hopkins OMIM database record ID

128992, and in cited publications numbered 11668–11669 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Myxovirus (influenza virus) Resistance 1, Interferon-inducible Protein P78 (mouse) (MX1, Accession NM\_002462) is another VGAM1659 host target gene. MX1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MX1 BINDING SITE, designated SEQ ID:8292, to the nucleotide sequence of VGAM1659 RNA, herein designated VGAM RNA, also designated SEQ ID:4370.

[56111] Another function of VGAM1659 is therefore inhibition of Myxovirus (influenza virus) Resistance 1, Interferon-inducible Protein P78 (mouse) (MX1, Accession NM\_002462), a gene which is responsible for a specific antiviral state against influenza virus infection. Accordingly, utilities of VGAM1659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MX1. The function of MX1 and its association with various diseases and clinical conditions, has been es-

established by previous studies, as described hereinabove with reference to VGAM973. Transducin (beta)-like 1X-linked (TBL1X, Accession NM\_005647) is another VGAM1659 host target gene. TBL1X BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TBL1X, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TBL1X BINDING SITE, designated SEQ ID:12180, to the nucleotide sequence of VGAM1659 RNA, herein designated VGAM RNA, also designated SEQ ID:4370.

[56112] Another function of VGAM1659 is therefore inhibition of Transducin (beta)-like 1X-linked (TBL1X, Accession NM\_005647), a gene which activates latent HDAC3 activity. Accordingly, utilities of VGAM1659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBL1X. The function of TBL1X and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1151. ATPW (Accession NM\_015684) is another VGAM1659 host target gene. ATPW BINDING SITE is HOST TARGET binding site

found in the 5' untranslated region of mRNA encoded by ATPW, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATPW BINDING SITE, designated SEQ ID:17908, to the nucleotide sequence of VGAM1659 RNA, herein designated VGAM RNA, also designated SEQ ID:4370.

[56113] Another function of VGAM1659 is therefore inhibition of ATPW (Accession NM\_015684). Accordingly, utilities of VGAM1659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATPW. Chemokine (C-C motif) Receptor 1 (CCR1, Accession NM\_001295) is another VGAM1659 host target gene. CCR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CCR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCR1 BINDING SITE, designated SEQ ID:6974, to the nucleotide sequence of VGAM1659 RNA, herein designated VGAM RNA, also designated SEQ ID:4370.

[56114] Another function of VGAM1659 is therefore inhibition of Chemokine (C-C motif) Receptor 1 (CCR1, Accession

NM\_001295). Accordingly, utilities of VGAM1659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCR1. FLJ12552 (Accession NM\_022832) is another VGAM1659 host target gene.

FLJ12552 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12552, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12552 BINDING SITE, designated SEQ ID:23115, to the nucleotide sequence of VGAM1659 RNA, herein designated VGAM RNA, also designated SEQ ID:4370.

[56115] Another function of VGAM1659 is therefore inhibition of FLJ12552 (Accession NM\_022832). Accordingly, utilities of VGAM1659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12552. FLJ20306 (Accession NM\_017756) is another VGAM1659 host target gene. FLJ20306 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ20306, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of FLJ20306 BINDING SITE, designated SEQ ID:19368, to the nucleotide sequence of VGAM1659 RNA, herein designated VGAM RNA, also designated SEQ ID:4370.

[56116] Another function of VGAM1659 is therefore inhibition of FLJ20306 (Accession NM\_017756). Accordingly, utilities of VGAM1659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20306. FLJ32865 (Accession NM\_144613) is another VGAM1659 host target gene. FLJ32865 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ32865, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ32865 BINDING SITE, designated SEQ ID:29424, to the nucleotide sequence of VGAM1659 RNA, herein designated VGAM RNA, also designated SEQ ID:4370.

[56117] Another function of VGAM1659 is therefore inhibition of FLJ32865 (Accession NM\_144613). Accordingly, utilities of VGAM1659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32865. KIAA1910 (Accession XM\_055514) is another

VGAM1659 host target gene. KIAA1910 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1910, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1910 BINDING SITE, designated SEQ ID:36288, to the nucleotide sequence of VGAM1659 RNA, herein designated VGAM RNA, also designated SEQ ID:4370.

[56118] Another function of VGAM1659 is therefore inhibition of KIAA1910 (Accession XM\_055514). Accordingly, utilities of VGAM1659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1910. LOC143888 (Accession XM\_084669) is another VGAM1659 host target gene. LOC143888 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC143888, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143888 BINDING SITE, designated SEQ ID:37668, to the nucleotide sequence of VGAM1659 RNA, herein designated VGAM RNA, also designated SEQ ID:4370.

[56119] Another function of VGAM1659 is therefore inhibition of LOC143888 (Accession XM\_084669). Accordingly, utilities of VGAM1659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143888. LOC157737 (Accession XM\_098819) is another VGAM1659 host target gene. LOC157737 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157737, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157737 BINDING SITE, designated SEQ ID:41842, to the nucleotide sequence of VGAM1659 RNA, herein designated VGAM RNA, also designated SEQ ID:4370.

[56120] Another function of VGAM1659 is therefore inhibition of LOC157737 (Accession XM\_098819). Accordingly, utilities of VGAM1659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157737. LOC158310 (Accession XM\_098919) is another VGAM1659 host target gene. LOC158310 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158310, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158310 BINDING SITE, designated SEQ ID:41948, to the nucleotide sequence of VGAM1659 RNA, herein designated VGAM RNA, also designated SEQ ID:4370.

[56121] Another function of VGAM1659 is therefore inhibition of LOC158310 (Accession XM\_098919). Accordingly, utilities of VGAM1659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158310. LOC163033 (Accession XM\_091949) is another VGAM1659 host target gene. LOC163033 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC163033, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163033 BINDING SITE, designated SEQ ID:40073, to the nucleotide sequence of VGAM1659 RNA, herein designated VGAM RNA, also designated SEQ ID:4370.

[56122] Another function of VGAM1659 is therefore inhibition of LOC163033 (Accession XM\_091949). Accordingly, utilities of VGAM1659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC163033. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1660 (VGAM1660) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[56123] VGAM1660 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1660 was detected is described hereinabove with reference to Figs. 1–8.

[56124] VGAM1660 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Molluscum Contagiosum Virus. VGAM1660 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[56125] VGAM1660 gene encodes a VGAM1660 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1660 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1660 precursor RNA is designated SEQ ID:1646, and is provided hereinbelow with ref–

erence to the sequence listing part. Nucleotide sequence SEQ ID:1646 is located at position 5477 relative to the genome of Molluscum Contagiosum Virus.

- [56126] VGAM1660 precursor RNA folds onto itself, forming VGAM1660 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [56127] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1660 folded precursor RNA into VGAM1660 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM1660 RNA is designated SEQ ID:4371, and is provided hereinbelow with reference to the sequence listing part.

[56128] VGAM1660 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1660 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1660 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[56129] VGAM1660 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1660 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1660 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1660 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM1660 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[56130] The complementary binding of VGAM1660 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1660 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1660 host target RNA into VGAM1660 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[56131] It is appreciated that VGAM1660 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1660 host target genes. The mRNA of each one of this plurality of VGAM1660 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1660 RNA, herein designated VGAM RNA, and which when bound by VGAM1660 RNA causes

inhibition of translation of respective one or more VGAM1660 host target proteins.

[56132] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1660 gene, herein designated VGAM GENE, on one or more VGAM1660 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[56133] It is yet further appreciated that a function of VGAM1660 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1660 include diagnosis, prevention and

treatment of viral infection by Mollusum Contagiosum Virus. Specific functions, and accordingly utilities, of VGAM1660 correlate with, and may be deduced from, the identity of the host target genes which VGAM1660 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[56134] Nucleotide sequences of the VGAM1660 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1660 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1660 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1660 are further described hereinbelow with reference to Table 1.

[56135] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1660 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1660 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[56136] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1660 gene, herein designated VGAM is inhibition of expression of VGAM1660 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM1660 correlate with, and may be deduced from, the identity of the target genes which VGAM1660 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[56137] BTG Family, Member 2 (BTG2, Accession NM\_006763) is a VGAM1660 host target gene. BTG2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BTG2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BTG2 BINDING SITE, designated SEQ ID:13621, to the nucleotide sequence of VGAM1660 RNA, herein designated VGAM RNA, also designated SEQ ID:4371.

[56138] A function of VGAM1660 is therefore inhibition of BTG Family, Member 2 (BTG2, Accession NM\_006763). Accordingly, utilities of VGAM1660 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BTG2. Casein Kinase 1, Gamma 1 (CSNK1G1, Accession NM\_022048) is another VGAM1660 host target gene. CSNK1G1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by CSNK1G1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSNK1G1 BINDING SITE, designated SEQ ID:22568, to the nucleotide sequence of VGAM1660 RNA, herein designated VGAM RNA, also designated SEQ ID:4371.

[56139] Another function of VGAM1660 is therefore inhibition of Casein Kinase 1, Gamma 1 (CSNK1G1, Accession NM\_022048). Accordingly, utilities of VGAM1660 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSNK1G1. KIAA0528 (Accession XM\_051454) is another VGAM1660 host target gene. KIAA0528 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0528, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0528 BINDING SITE, designated SEQ ID:35840, to the nucleotide sequence of VGAM1660 RNA, herein designated VGAM RNA, also designated SEQ ID:4371.

[56140] Another function of VGAM1660 is therefore inhibition of

KIAA0528 (Accession XM\_051454). Accordingly, utilities of VGAM1660 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0528. KIAA0987 (Accession NM\_012307) is another VGAM1660 host target gene. KIAA0987 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0987, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0987 BINDING SITE, designated SEQ ID:14674, to the nucleotide sequence of VGAM1660 RNA, herein designated VGAM RNA, also designated SEQ ID:4371.

[56141] Another function of VGAM1660 is therefore inhibition of KIAA0987 (Accession NM\_012307). Accordingly, utilities of VGAM1660 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0987. KIAA1117 (Accession XM\_028219) is another VGAM1660 host target gene. KIAA1117 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1117, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1117 BINDING SITE, designated SEQ ID:30634, to the nucleotide sequence of VGAM1660 RNA, herein designated VGAM RNA, also designated SEQ ID:4371.

[56142] Another function of VGAM1660 is therefore inhibition of KIAA1117 (Accession XM\_028219). Accordingly, utilities of VGAM1660 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1117. LOC149146 (Accession XM\_086441) is another VGAM1660 host target gene. LOC149146 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149146, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149146 BINDING SITE, designated SEQ ID:38656, to the nucleotide sequence of VGAM1660 RNA, herein designated VGAM RNA, also designated SEQ ID:4371.

[56143] Another function of VGAM1660 is therefore inhibition of LOC149146 (Accession XM\_086441). Accordingly, utilities of VGAM1660 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149146. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1661 (VGAM1661) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[56144] VGAM1661 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1661 was detected is described hereinabove with reference to Figs. 1–8.

[56145] VGAM1661 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine Herpesvirus 7. VGAM1661 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[56146] VGAM1661 gene encodes a VGAM1661 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1661 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1661 precursor RNA is designated SEQ ID:1647, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:1647 is located at position 100245 relative to the genome of Cercopithecine Herpesvirus 7.

[56147] VGAM1661 precursor RNA folds onto itself, forming VGAM1661 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[56148] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1661 folded precursor RNA into VGAM1661 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1661 RNA is designated SEQ ID:4372, and is provided hereinbelow with reference to the sequence listing part.

[56149] VGAM1661 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1661 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1661 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[56150] VGAM1661 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1661 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1661 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1661 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1661 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[56151] The complementary binding of VGAM1661 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1661 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1661 host target RNA into VGAM1661 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[56152] It is appreciated that VGAM1661 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1661 host target genes. The mRNA of each one of this plurality of VGAM1661 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1661 RNA, herein designated VGAM RNA, and which when bound by VGAM1661 RNA causes inhibition of translation of respective one or more

VGAM1661 host target proteins.

[56153] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1661 gene, herein designated VGAM GENE, on one or more VGAM1661 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[56154] It is yet further appreciated that a function of VGAM1661 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1661 include diagnosis, prevention and treatment of viral infection by Cercopithecine Herpesvirus

7. Specific functions, and accordingly utilities, of VGAM1661 correlate with, and may be deduced from, the identity of the host target genes which VGAM1661 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[56155] Nucleotide sequences of the VGAM1661 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1661 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1661 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1661 are further described hereinbelow with reference to Table 1.

[56156] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1661 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1661 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[56157] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1661 gene, herein designated VGAM is inhibition of expression of VGAM1661 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM1661 correlate with, and may be deduced from, the identity of the target genes which VGAM1661 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[56158] Ephrin-A5 (EFNA5, Accession NM\_001962) is a VGAM1661 host target gene. EFNA5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EFNA5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EFNA5 BINDING SITE, designated SEQ ID:7683, to the nucleotide sequence of VGAM1661 RNA, herein designated VGAM RNA, also designated SEQ ID:4372.

[56159] A function of VGAM1661 is therefore inhibition of Ephrin-A5 (EFNA5, Accession NM\_001962). Accordingly, utilities of VGAM1661 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EFNA5. LOC151445 (Accession XM\_045283) is another VGAM1661 host target gene. LOC151445 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151445, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151445 BINDING SITE, designated SEQ ID:34418, to the nucleotide sequence of VGAM1661 RNA, herein designated VGAM RNA, also designated SEQ ID:4372.

[56160] Another function of VGAM1661 is therefore inhibition of LOC151445 (Accession XM\_045283). Accordingly, utilities of VGAM1661 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151445. LOC161635 (Accession XM\_172921) is another VGAM1661 host target gene. LOC161635 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC161635, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC161635 BINDING SITE, designated SEQ ID:46183, to the nucleotide sequence of VGAM1661 RNA, herein designated VGAM RNA, also designated SEQ ID:4372.

[56161] Another function of VGAM1661 is therefore inhibition of LOC161635 (Accession XM\_172921). Accordingly, utilities of VGAM1661 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC161635. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1662 (VGAM1662) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[56162] VGAM1662 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1662 was detected is described hereinabove with reference to Figs. 1–8.

[56163] VGAM1662 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine Herpesvirus 7. VGAM1662 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[56164] VGAM1662 gene encodes a VGAM1662 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1662 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1662 precursor RNA is designated SEQ ID:1648, and is provided hereinbelow with ref–

erence to the sequence listing part. Nucleotide sequence SEQ ID:1648 is located at position 99606 relative to the genome of Cercopithecine Herpesvirus 7.

- [56165] VGAM1662 precursor RNA folds onto itself, forming VGAM1662 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [56166] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1662 folded precursor RNA into VGAM1662 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1662 RNA is designated SEQ ID:4373, and is provided hereinbelow with reference to the sequence listing part.

[56167] VGAM1662 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1662 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1662 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[56168] VGAM1662 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1662 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1662 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1662 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM1662 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[56169] The complementary binding of VGAM1662 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1662 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1662 host target RNA into VGAM1662 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[56170] It is appreciated that VGAM1662 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1662 host target genes. The mRNA of each one of this plurality of VGAM1662 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1662 RNA, herein designated VGAM RNA, and which when bound by VGAM1662 RNA causes

inhibition of translation of respective one or more VGAM1662 host target proteins.

[56171] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1662 gene, herein designated VGAM GENE, on one or more VGAM1662 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[56172] It is yet further appreciated that a function of VGAM1662 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1662 include diagnosis, prevention and

treatment of viral infection by Cercopithecine Herpesvirus 7. Specific functions, and accordingly utilities, of VGAM1662 correlate with, and may be deduced from, the identity of the host target genes which VGAM1662 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[56173] Nucleotide sequences of the VGAM1662 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1662 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1662 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1662 are further described hereinbelow with reference to Table 1.

[56174] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1662 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1662 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[56175] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1662 gene, herein designated VGAM is inhibition of expression of VGAM1662 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM1662 correlate with, and may be deduced from, the identity of the target genes which VGAM1662 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[56176] Dystroglycan 1 (dystrophin-associated glycoprotein 1) (DAG1, Accession NM\_004393) is a VGAM1662 host target gene. DAG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DAG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAG1 BINDING SITE, designated SEQ ID:10635, to the nucleotide sequence of VGAM1662 RNA, herein designated VGAM RNA, also designated SEQ ID:4373.

[56177] A function of VGAM1662 is therefore inhibition of Dystroglycan 1 (dystrophin-associated glycoprotein 1) (DAG1, Accession NM\_004393), a gene which may provide linkage between the sarcolemma and extracellular matrix (ECM). Accordingly, utilities of VGAM1662 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAG1. The function of DAG1 and its association with various diseases and clinical conditions,

has been established by previous studies, as described hereinabove with reference to VGAM1095. Heterogeneous Nuclear Ribonucleoprotein D-like (HNRPDL, Accession NM\_005463) is another VGAM1662 host target gene. HNRPDL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HNRPDL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HNRPDL BINDING SITE, designated SEQ ID:11951, to the nucleotide sequence of VGAM1662 RNA, herein designated VGAM RNA, also designated SEQ ID:4373.

[56178] Another function of VGAM1662 is therefore inhibition of Heterogeneous Nuclear Ribonucleoprotein D-like (HNRPDL, Accession NM\_005463), a gene which binds to rna molecules that contain au-rich elements. Accordingly, utilities of VGAM1662 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HNRPDL. The function of HNRPDL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM144. Phosphodiesterase 7A

(PDE7A, Accession XM\_037534) is another VGAM1662 host target gene. PDE7A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDE7A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE7A BINDING SITE, designated SEQ ID:32641, to the nucleotide sequence of VGAM1662 RNA, herein designated VGAM RNA, also designated SEQ ID:4373.

[56179] Another function of VGAM1662 is therefore inhibition of Phosphodiesterase 7A (PDE7A, Accession XM\_037534), a gene which is a CAMP-specific phosphodiesterase 7A and plays a role in signal transduction. Accordingly, utilities of VGAM1662 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE7A. The function of PDE7A has been established by previous studies. Cyclic nucleotides serve as second messengers that mediate a variety of cellular responses to extracellular signals such as hormones, light, and neurotransmitters. Cyclic nucleotide phosphodiesterases (PDEs) play a role in signal transduction by regulating the cellular concentrations of cyclic nucleotides. Mammalian cells contain

multiple PDEs that are distinguished into at least 7 families based on their substrate affinity and on their selective sensitivity to cofactors and inhibitory drugs. These families are: (I)  $\text{Ca}^{2+}$ /calmodulin-dependent PDEs; (II) cGMP-stimulated PDEs; (III) cGMP-inhibited PDEs; (IV) cAMP-specific PDEs; (V) cGMP-specific PDEs; (VI) photoreceptor PDEs; and (VII) high-affinity, cAMP-specific. From the amino acid sequences, it is evident that all these PDE families contain a related domain, thought to be the catalytic domain, with approximately 30% sequence identity between families. Members of the same family are more closely related; they share 60 to 80% sequence identity throughout the entire coding region. Michaeli et al. (1993) established a highly sensitive functional screen for the isolation of cDNAs encoding cAMP phosphodiesterases by complementation of defects in the *Saccharomyces cerevisiae* strain lacking both endogenous cAMP PDE genes, PDE1 and PDE2. Three groups of cDNAs corresponding to 3 distinct human genes encoding cAMP-specific PDEs were isolated from a human glioblastoma cDNA library using this functional screen. Two of the genes were closely related to the *Drosophila* 'dunce' cAMP-specific PDE. The third gene, which Michaeli et al. (1993) referred

to as HCP1, encoded a novel cAMP-specific PDE. HCP1 had an amino acid sequence related to the sequences of the catalytic domains of all cyclic nucleotide PDEs. It is a high-affinity cAMP-specific PDE that does not share other properties of the cAMP-specific PDE family, however. The PDE activity of HCP1 was not sensitive to cGMP or other inhibitors of the cGMP-inhibitable PDEs. The biochemical and pharmacologic properties of HCP1 suggested to Michaeli et al. (1993) that it is a member of a previously undiscovered cyclic nucleotide PDE family, which they designated as family VII. Northern blot analysis indicated the presence of high levels of an HCP1 mRNA in human skeletal muscle.

[56180] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Isolation and characterization of a previously undetected human c.

[56183] Further studies establishing the function and utilities of PDE7A are found in John Hopkins OMIM database record ID 171885, and in cited publications numbered 12443–12445 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Ret Finger Protein (RFP, Accession NM\_006510) is another VGAM1662 host target gene. RFP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RFP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RFP BINDING SITE, designated SEQ ID:13262, to the nucleotide sequence of VGAM1662 RNA, herein designated VGAM RNA, also designated SEQ ID:4373.

[56184] Another function of VGAM1662 is therefore inhibition of Ret Finger Protein (RFP, Accession NM\_006510), a gene which involves in transcriptional regulation and may act in male germ cell development. Accordingly, utilities of VGAM1662 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RFP.

The function of RFP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM302.DKFZp434G179 (Accession XM\_087065) is another VGAM1662 host target gene. DKFZp434G179 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp434G179, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434G179 BINDING SITE, designated SEQ ID:39044, to the nucleotide sequence of VGAM1662 RNA, herein designated VGAM RNA, also designated SEQ ID:4373.

[56185] Another function of VGAM1662 is therefore inhibition of DKFZp434G179 (Accession XM\_087065). Accordingly, utilities of VGAM1662 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434G179. Family with Sequence Similarity 8, Member A1 (FAM8A1, Accession NM\_016255) is another VGAM1662 host target gene. FAM8A1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FAM8A1, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FAM8A1 BINDING SITE, designated SEQ ID:18382, to the nucleotide sequence of VGAM1662 RNA, herein designated VGAM RNA, also designated SEQ ID:4373.

[56186] Another function of VGAM1662 is therefore inhibition of Family with Sequence Similarity 8, Member A1 (FAM8A1, Accession NM\_016255). Accordingly, utilities of VGAM1662 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FAM8A1. FLJ13456 (Accession XM\_038291) is another VGAM1662 host target gene. FLJ13456 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13456, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13456 BINDING SITE, designated SEQ ID:32799, to the nucleotide sequence of VGAM1662 RNA, herein designated VGAM RNA, also designated SEQ ID:4373.

[56187] Another function of VGAM1662 is therefore inhibition of FLJ13456 (Accession XM\_038291). Accordingly, utilities of

VGAM1662 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13456. KIAA1189 (Accession XM\_050508) is another VGAM1662 host target gene. KIAA1189 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1189, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1189 BINDING SITE, designated SEQ ID:35653, to the nucleotide sequence of VGAM1662 RNA, herein designated VGAM RNA, also designated SEQ ID:4373.

[56188] Another function of VGAM1662 is therefore inhibition of KIAA1189 (Accession XM\_050508). Accordingly, utilities of VGAM1662 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1189. Phospholipase A2-activating Protein (PLAA, Accession NM\_004253) is another VGAM1662 host target gene. PLAA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PLAA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of PLAA BINDING SITE, designated SEQ ID:10441, to the nucleotide sequence of VGAM1662 RNA, herein designated VGAM RNA, also designated SEQ ID:4373.

[56189] Another function of VGAM1662 is therefore inhibition of Phospholipase A2-activating Protein (PLAA, Accession NM\_004253). Accordingly, utilities of VGAM1662 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLAA. Solute Carrier Family 2 (facilitated glucose transporter), Member 13 (SLC2A13, Accession NM\_052885) is another VGAM1662 host target gene. SLC2A13 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC2A13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC2A13 BINDING SITE, designated SEQ ID:27466, to the nucleotide sequence of VGAM1662 RNA, herein designated VGAM RNA, also designated SEQ ID:4373.

[56190] Another function of VGAM1662 is therefore inhibition of Solute Carrier Family 2 (facilitated glucose transporter), Member 13 (SLC2A13, Accession NM\_052885). Accordingly, utilities of VGAM1662 include diagnosis, prevention

and treatment of diseases and clinical conditions associated with SLC2A13. Extracellular Link Domain Containing 1 (XLKD1, Accession NM\_006691) is another VGAM1662 host target gene. XLKD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by XLKD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of XLKD1 BINDING SITE, designated SEQ ID:13507, to the nucleotide sequence of VGAM1662 RNA, herein designated VGAM RNA, also designated SEQ ID:4373.

[56191] Another function of VGAM1662 is therefore inhibition of Extracellular Link Domain Containing 1 (XLKD1, Accession NM\_006691). Accordingly, utilities of VGAM1662 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XLKD1. LOC144997 (Accession XM\_096702) is another VGAM1662 host target gene. LOC144997 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144997, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of LOC144997 BINDING SITE, designated SEQ ID:40483, to the nucleotide sequence of VGAM1662 RNA, herein designated VGAM RNA, also designated SEQ ID:4373.

[56192] Another function of VGAM1662 is therefore inhibition of LOC144997 (Accession XM\_096702). Accordingly, utilities of VGAM1662 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144997. LOC149076 (Accession XM\_086415) is another VGAM1662 host target gene. LOC149076 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149076, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149076 BINDING SITE, designated SEQ ID:38638, to the nucleotide sequence of VGAM1662 RNA, herein designated VGAM RNA, also designated SEQ ID:4373.

[56193] Another function of VGAM1662 is therefore inhibition of LOC149076 (Accession XM\_086415). Accordingly, utilities of VGAM1662 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149076. LOC152674 (Accession XM\_098251) is an-

other VGAM1662 host target gene. LOC152674 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152674, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152674 BINDING SITE, designated SEQ ID:41538, to the nucleotide sequence of VGAM1662 RNA, herein designated VGAM RNA, also designated SEQ ID:4373.

[56194] Another function of VGAM1662 is therefore inhibition of LOC152674 (Accession XM\_098251). Accordingly, utilities of VGAM1662 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152674. LOC158038 (Accession XM\_088446) is another VGAM1662 host target gene. LOC158038 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158038, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158038 BINDING SITE, designated SEQ ID:39700, to the nucleotide sequence of VGAM1662 RNA, herein designated VGAM RNA, also designated SEQ ID:4373.

[56195] Another function of VGAM1662 is therefore inhibition of LOC158038 (Accession XM\_088446). Accordingly, utilities of VGAM1662 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158038. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1663 (VGAM1663) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[56196] VGAM1663 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1663 was detected is described hereinabove with reference to Figs. 1–8.

[56197] VGAM1663 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine Herpesvirus 7. VGAM1663 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[56198] VGAM1663 gene encodes a VGAM1663 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM1663 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1663 precursor RNA is designated SEQ ID:1649, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1649 is located at position 98907 relative to the genome of Cercopithecine Herpesvirus 7.

[56199] VGAM1663 precursor RNA folds onto itself, forming VGAM1663 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[56200] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1663 folded precursor RNA into VGAM1663 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1663 RNA is designated SEQ ID:4374, and is provided hereinbelow with reference to the sequence listing part.

[56201] VGAM1663 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1663 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1663 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[56202] VGAM1663 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1663 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1663 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1663 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1663 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[56203] The complementary binding of VGAM1663 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1663 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1663 host target RNA into VGAM1663 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[56204] It is appreciated that VGAM1663 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1663 host target genes. The mRNA of each one of this plurality of VGAM1663 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1663 RNA, herein designated VGAM RNA, and which when bound by VGAM1663 RNA causes inhibition of translation of respective one or more VGAM1663 host target proteins.

[56205] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1663 gene, herein designated VGAM GENE, on one or more VGAM1663 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[56206] It is yet further appreciated that a function of VGAM1663 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1663 include diagnosis, prevention and treatment of viral infection by Cercopithecine Herpesvirus 7. Specific functions, and accordingly utilities, of VGAM1663 correlate with, and may be deduced from, the identity of the host target genes which VGAM1663 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[56207] Nucleotide sequences of the VGAM1663 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1663 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1663 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1663 are further described hereinbelow with reference to Table 1.

[56208] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1663 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1663 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[56209] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1663 gene, herein designated VGAM is inhibition of expression of VGAM1663 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1663 correlate with, and may be deduced from, the identity of the target genes which VGAM1663 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[56210] EphA3 (EPHA3, Accession NM\_005233) is a VGAM1663 host target gene. EPHA3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EPHA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPHA3 BINDING SITE, designated SEQ ID:11741, to the nucleotide sequence of VGAM1663 RNA, herein designated VGAM RNA, also designated SEQ ID:4374.

[56211] A function of VGAM1663 is therefore inhibition of EphA3 (EPHA3, Accession NM\_005233), a gene which binds to ephrin-a2, -a3, -a4 and -a5. could play a role in lymphoid function. Accordingly, utilities of VGAM1663 in-

clude diagnosis, prevention and treatment of diseases and clinical conditions associated with EPHA3. The function of EPHA3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM164. Natriuretic Peptide Receptor A/guanylate Cyclase A (atrionatriuretic peptide receptor A) (NPR1, Accession XM\_113360) is another VGAM1663 host target gene. NPR1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NPR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NPR1 BINDING SITE, designated SEQ ID:42234, to the nucleotide sequence of VGAM1663 RNA, herein designated VGAM RNA, also designated SEQ ID:4374.

[56212] Another function of VGAM1663 is therefore inhibition of Natriuretic Peptide Receptor A/guanylate Cyclase A (atrionatriuretic peptide receptor A) (NPR1, Accession XM\_113360), a gene which has guanylate cyclase activity on binding of anp. Accordingly, utilities of VGAM1663 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPR1. The function of

NPR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM719.SH3-domain Binding Protein 2 (SH3BP2, Accession NM\_003023) is another VGAM1663 host target gene. SH3BP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SH3BP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SH3BP2 BINDING SITE, designated SEQ ID:8943, to the nucleotide sequence of VGAM1663 RNA, herein designated VGAM RNA, also designated SEQ ID:4374.

[56213] Another function of VGAM1663 is therefore inhibition of SH3-domain Binding Protein 2 (SH3BP2, Accession NM\_003023). Accordingly, utilities of VGAM1663 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SH3BP2. CDC14 Cell Division Cycle 14 Homolog A (*S. cerevisiae*) (CDC14A, Accession NM\_003672) is another VGAM1663 host target gene. CDC14A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

CDC14A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDC14A BINDING SITE, designated SEQ ID:9763, to the nucleotide sequence of VGAM1663 RNA, herein designated VGAM RNA, also designated SEQ ID:4374.

[56214] Another function of VGAM1663 is therefore inhibition of CDC14 Cell Division Cycle 14 Homolog A (*S. cerevisiae*) (CDC14A, Accession NM\_003672). Accordingly, utilities of VGAM1663 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDC14A. LOC219376 (Accession XM\_168147) is another VGAM1663 host target gene. LOC219376 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219376, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219376 BINDING SITE, designated SEQ ID:45068, to the nucleotide sequence of VGAM1663 RNA, herein designated VGAM RNA, also designated SEQ ID:4374.

[56215] Another function of VGAM1663 is therefore inhibition of

LOC219376 (Accession XM\_168147). Accordingly, utilities of VGAM1663 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219376. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1664 (VGAM1664) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[56216] VGAM1664 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1664 was detected is described hereinabove with reference to Figs. 1-8.

[56217] VGAM1664 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine Herpesvirus 7. VGAM1664 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[56218] VGAM1664 gene encodes a VGAM1664 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1664 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1664 precursor RNA is designated SEQ ID:1650, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1650 is located at position 105330 relative to the genome of Cercopithecine Herpesvirus 7.

- [56219] VGAM1664 precursor RNA folds onto itself, forming VGAM1664 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [56220] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1664 folded precursor RNA into VGAM1664 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide se-

quence of VGAM1664 RNA is designated SEQ ID:4375, and is provided hereinbelow with reference to the sequence listing part.

[56221] VGAM1664 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1664 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1664 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[56222] VGAM1664 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1664 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1664 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM1664 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1664 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[56223] The complementary binding of VGAM1664 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1664 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1664 host target RNA into VGAM1664 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[56224] It is appreciated that VGAM1664 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1664 host target genes. The mRNA of each one of this plurality of VGAM1664 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1664 RNA, herein designated VGAM RNA, and which when bound by VGAM1664 RNA causes inhibition of translation of respective one or more VGAM1664 host target proteins.

[56225] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1664 gene, herein designated VGAM GENE, on one or more VGAM1664 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[56226] It is yet further appreciated that a function of VGAM1664

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1664 include diagnosis, prevention and treatment of viral infection by Cercopithecine Herpesvirus 7. Specific functions, and accordingly utilities, of VGAM1664 correlate with, and may be deduced from, the identity of the host target genes which VGAM1664 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[56227] Nucleotide sequences of the VGAM1664 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1664 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1664 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1664 are further described hereinbelow with reference to Table 1.

[56228] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1664 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1664 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[56229] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1664 gene, herein designated VGAM is inhibition of expression of VGAM1664 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1664 correlate with, and may be deduced from, the identity of the target genes which VGAM1664 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[56230] BLAME (Accession NM\_020125) is a VGAM1664 host target gene. BLAME BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BLAME, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BLAME BINDING SITE, designated SEQ ID:21307, to the nucleotide sequence of VGAM1664 RNA, herein designated VGAM RNA, also designated SEQ ID:4375.

[56231] A function of VGAM1664 is therefore inhibition of BLAME (Accession NM\_020125). Accordingly, utilities of VGAM1664 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BLAME. DXYS155E (Accession NM\_005088) is another VGAM1664

host target gene. DXYS155E BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DXYS155E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DXYS155E BINDING SITE, designated SEQ ID:11543, to the nucleotide sequence of VGAM1664 RNA, herein designated VGAM RNA, also designated SEQ ID:4375.

[56232] Another function of VGAM1664 is therefore inhibition of DXYS155E (Accession NM\_005088), a gene which may be involved in b-cell activation. may also be involved in signal transduction and gene regulation. Accordingly, utilities of VGAM1664 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DXYS155E. The function of DXYS155E and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM766. Engrailed Homolog 1 (EN1, Accession NM\_001426) is another VGAM1664 host target gene. EN1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EN1, corresponding to a HOST TARGET binding site such

as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EN1 BINDING SITE, designated SEQ ID:7140, to the nucleotide sequence of VGAM1664 RNA, herein designated VGAM RNA, also designated SEQ ID:4375.

[56233] Another function of VGAM1664 is therefore inhibition of Engrailed Homolog 1 (EN1, Accession NM\_001426), a gene which is a member of the homeodomain family of DNA binding proteins; may regulate gene expression, morphogenesis, and differentiation;. Accordingly, utilities of VGAM1664 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EN1. The function of EN1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1615. Sialyltransferase 8E (alpha-2, 8-polysialyltransferase) (SIAT8E, Accession XM\_008705) is another VGAM1664 host target gene. SIAT8E BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SIAT8E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIAT8E BIND-

ING SITE, designated SEQ ID:30090, to the nucleotide sequence of VGAM1664 RNA, herein designated VGAM RNA, also designated SEQ ID:4375.

[56234] Another function of VGAM1664 is therefore inhibition of Sialyltransferase 8E (alpha-2, 8-polysialyltransferase) (SIAT8E, Accession XM\_008705). Accordingly, utilities of VGAM1664 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIAT8E. Tumor Necrosis Factor Receptor Superfamily, Member 6b, Decoy (TNFRSF6B, Accession NM\_032945) is another VGAM1664 host target gene. TNFRSF6B BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TNFRSF6B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFRSF6B BINDING SITE, designated SEQ ID:26762, to the nucleotide sequence of VGAM1664 RNA, herein designated VGAM RNA, also designated SEQ ID:4375.

[56235] Another function of VGAM1664 is therefore inhibition of Tumor Necrosis Factor Receptor Superfamily, Member 6b, Decoy (TNFRSF6B, Accession NM\_032945), a gene which is decoy receptor and protects against apoptosis. Accord-

ingly, utilities of VGAM1664 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFRSF6B. The function of TNFRSF6B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM610.FLJ22246 (Accession NM\_025232) is another VGAM1664 host target gene. FLJ22246 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ22246, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22246 BINDING SITE, designated SEQ ID:24910, to the nucleotide sequence of VGAM1664 RNA, herein designated VGAM RNA, also designated SEQ ID:4375.

[56236] Another function of VGAM1664 is therefore inhibition of FLJ22246 (Accession NM\_025232). Accordingly, utilities of VGAM1664 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22246. KIAA1091 (Accession XM\_045750) is another VGAM1664 host target gene. KIAA1091 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by KIAA1091, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1091 BINDING SITE, designated SEQ ID:34542, to the nucleotide sequence of VGAM1664 RNA, herein designated VGAM RNA, also designated SEQ ID:4375.

[56237] Another function of VGAM1664 is therefore inhibition of KIAA1091 (Accession XM\_045750). Accordingly, utilities of VGAM1664 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1091. KIAA1691 (Accession XM\_166523) is another VGAM1664 host target gene. KIAA1691 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1691, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1691 BINDING SITE, designated SEQ ID:44466, to the nucleotide sequence of VGAM1664 RNA, herein designated VGAM RNA, also designated SEQ ID:4375.

[56238] Another function of VGAM1664 is therefore inhibition of KIAA1691 (Accession XM\_166523). Accordingly, utilities

of VGAM1664 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1691. RAB39, Member RAS Oncogene Family (RAB39, Accession XM\_084662) is another VGAM1664 host target gene. RAB39 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB39, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB39 BINDING SITE, designated SEQ ID:37644, to the nucleotide sequence of VGAM1664 RNA, herein designated VGAM RNA, also designated SEQ ID:4375.

[56239] Another function of VGAM1664 is therefore inhibition of RAB39, Member RAS Oncogene Family (RAB39, Accession XM\_084662). Accordingly, utilities of VGAM1664 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB39. LOC150407 (Accession XM\_086906) is another VGAM1664 host target gene. LOC150407 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150407, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150407 BINDING SITE, designated SEQ ID:38953, to the nucleotide sequence of VGAM1664 RNA, herein designated VGAM RNA, also designated SEQ ID:4375.

[56240] Another function of VGAM1664 is therefore inhibition of LOC150407 (Accession XM\_086906). Accordingly, utilities of VGAM1664 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150407. LOC169026 (Accession XM\_095471) is another VGAM1664 host target gene. LOC169026 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC169026, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC169026 BINDING SITE, designated SEQ ID:40264, to the nucleotide sequence of VGAM1664 RNA, herein designated VGAM RNA, also designated SEQ ID:4375.

[56241] Another function of VGAM1664 is therefore inhibition of LOC169026 (Accession XM\_095471). Accordingly, utilities of VGAM1664 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC169026. LOC203392 (Accession XM\_114696) is another VGAM1664 host target gene. LOC203392 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC203392, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203392 BINDING SITE, designated SEQ ID:43041, to the nucleotide sequence of VGAM1664 RNA, herein designated VGAM RNA, also designated SEQ ID:4375.

[56242] Another function of VGAM1664 is therefore inhibition of LOC203392 (Accession XM\_114696). Accordingly, utilities of VGAM1664 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203392. LOC222166 (Accession XM\_168425) is another VGAM1664 host target gene. LOC222166 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222166, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222166 BINDING SITE, designated SEQ ID:45152, to the nucleotide sequence of VGAM1664 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4375.

[56243] Another function of VGAM1664 is therefore inhibition of LOC222166 (Accession XM\_168425). Accordingly, utilities of VGAM1664 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222166. LOC93082 (Accession NM\_138397) is another VGAM1664 host target gene. LOC93082 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC93082, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93082 BINDING SITE, designated SEQ ID:28766, to the nucleotide sequence of VGAM1664 RNA, herein designated VGAM RNA, also designated SEQ ID:4375.

[56244] Another function of VGAM1664 is therefore inhibition of LOC93082 (Accession NM\_138397). Accordingly, utilities of VGAM1664 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93082. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1665 (VGAM1665) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[56245] VGAM1665 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1665 was detected is described hereinabove with reference to Figs. 1–8.

[56246] VGAM1665 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Infectious Spleen and Kidney Necrosis Virus. VGAM1665 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[56247] VGAM1665 gene encodes a VGAM1665 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1665 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1665 precursor RNA is designated SEQ ID:1651, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1651 is located at position 60134 relative to the genome of Infectious Spleen and Kidney Necrosis Virus.

[56248] VGAM1665 precursor RNA folds onto itself, forming

VGAM1665 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[56249] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1665 folded precursor RNA into VGAM1665 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1665 RNA is designated SEQ ID:4376, and is provided hereinbelow with reference to the sequence listing part.

[56250] VGAM1665 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1665 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1665 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[56251] VGAM1665 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1665 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1665 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1665 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1665 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[56252] The complementary binding of VGAM1665 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1665 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1665 host target RNA into VGAM1665 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[56253] It is appreciated that VGAM1665 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1665 host target genes. The mRNA of each one of this plurality of VGAM1665 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1665 RNA, herein designated VGAM RNA, and which when bound by VGAM1665 RNA causes inhibition of translation of respective one or more VGAM1665 host target proteins.

[56254] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1665 gene, herein designated VGAM GENE, on one or more VGAM1665 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[56255] It is yet further appreciated that a function of VGAM1665 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1665 include diagnosis, prevention and treatment of viral infection by Infectious Spleen and Kidney Necrosis Virus. Specific functions, and accordingly utilities, of VGAM1665 correlate with, and may be deduced from, the identity of the host target genes which

VGAM1665 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[56256] Nucleotide sequences of the VGAM1665 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1665 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1665 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1665 are further described hereinbelow with reference to Table 1.

[56257] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1665 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1665 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[56258] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1665 gene, herein designated VGAM is inhibition of expression of VGAM1665 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1665 correlate with, and may be deduced from, the identity of the target genes which VGAM1665 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[56259] Trichorhinophalangeal Syndrome I (TRPS1, Accession NM\_014112) is a VGAM1665 host target gene. TRPS1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TRPS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPS1 BINDING SITE, designated SEQ ID:15348, to the nucleotide sequence of VGAM1665 RNA, herein designated VGAM RNA, also designated SEQ ID:4376.

[56260] A function of VGAM1665 is therefore inhibition of Trichorhinophalangeal Syndrome I (TRPS1, Accession NM\_014112), a gene which may function as a transcriptional activator protein. Accordingly, utilities of VGAM1665 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPS1. The function of TRPS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM172.E2IG4 (Accession XM\_165623) is another VGAM1665 host target gene. E2IG4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region

of mRNA encoded by E2IG4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of E2IG4 BINDING SITE, designated SEQ ID:43702, to the nucleotide sequence of VGAM1665 RNA, herein designated VGAM RNA, also designated SEQ ID:4376.

[56261] Another function of VGAM1665 is therefore inhibition of E2IG4 (Accession XM\_165623). Accordingly, utilities of VGAM1665 include diagnosis, prevention and treatment of diseases and clinical conditions associated with E2IG4. FLJ13710 (Accession NM\_024817) is another VGAM1665 host target gene. FLJ13710 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13710, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13710 BINDING SITE, designated SEQ ID:24204, to the nucleotide sequence of VGAM1665 RNA, herein designated VGAM RNA, also designated SEQ ID:4376.

[56262] Another function of VGAM1665 is therefore inhibition of FLJ13710 (Accession NM\_024817). Accordingly, utilities of

VGAM1665 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13710. KIAA1582 (Accession XM\_037262) is another VGAM1665 host target gene. KIAA1582 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1582, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1582 BINDING SITE, designated SEQ ID:32586, to the nucleotide sequence of VGAM1665 RNA, herein designated VGAM RNA, also designated SEQ ID:4376.

[56263] Another function of VGAM1665 is therefore inhibition of KIAA1582 (Accession XM\_037262). Accordingly, utilities of VGAM1665 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1582. KIAA1706 (Accession XM\_166595) is another VGAM1665 host target gene. KIAA1706 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1706, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1706 BINDING SITE, designated SEQ ID:44576, to the nucleotide sequence of VGAM1665 RNA, herein designated VGAM RNA, also designated SEQ ID:4376.

[56264] Another function of VGAM1665 is therefore inhibition of KIAA1706 (Accession XM\_166595). Accordingly, utilities of VGAM1665 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1706. Purinergic Receptor P2X-like 1, Orphan Receptor (P2RXL1, Accession NM\_005446) is another VGAM1665 host target gene. P2RXL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by P2RXL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P2RXL1 BINDING SITE, designated SEQ ID:11928, to the nucleotide sequence of VGAM1665 RNA, herein designated VGAM RNA, also designated SEQ ID:4376.

[56265] Another function of VGAM1665 is therefore inhibition of Purinergic Receptor P2X-like 1, Orphan Receptor (P2RXL1, Accession NM\_005446). Accordingly, utilities of VGAM1665 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

P2RXL1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1666 (VGAM1666) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[56266] VGAM1666 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1666 was detected is described hereinabove with reference to Figs. 1–8.

[56267] VGAM1666 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Infectious Spleen and Kidney Necrosis Virus. VGAM1666 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[56268] VGAM1666 gene encodes a VGAM1666 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1666 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1666 precursor RNA is designated SEQ ID:1652, and is provided hereinbelow with ref–

erence to the sequence listing part. Nucleotide sequence SEQ ID:1652 is located at position 58471 relative to the genome of Infectious Spleen and Kidney Necrosis Virus.

[56269] VGAM1666 precursor RNA folds onto itself, forming VGAM1666 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[56270] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1666 folded precursor RNA into VGAM1666 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM1666 RNA is designated SEQ ID:4377, and is provided hereinbelow with reference to the sequence listing part.

[56271] VGAM1666 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1666 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1666 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[56272] VGAM1666 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1666 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1666 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1666 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM1666 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[56273] The complementary binding of VGAM1666 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1666 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1666 host target RNA into VGAM1666 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[56274] It is appreciated that VGAM1666 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1666 host target genes. The mRNA of each one of this plurality of VGAM1666 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1666 RNA, herein designated VGAM RNA, and which when bound by VGAM1666 RNA causes

inhibition of translation of respective one or more VGAM1666 host target proteins.

[56275] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1666 gene, herein designated VGAM GENE, on one or more VGAM1666 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[56276] It is yet further appreciated that a function of VGAM1666 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1666 include diagnosis, prevention and

treatment of viral infection by Infectious Spleen and Kidney Necrosis Virus. Specific functions, and accordingly utilities, of VGAM1666 correlate with, and may be deduced from, the identity of the host target genes which VGAM1666 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[56277] Nucleotide sequences of the VGAM1666 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1666 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1666 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1666 are further described hereinbelow with reference to Table 1.

[56278] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1666 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1666 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[56279] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1666 gene, herein designated VGAM is inhibition of expression of VGAM1666 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM1666 correlate with, and may be deduced from, the identity of the target genes which VGAM1666 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[56280] Coagulation Factor VIII, Procoagulant Component (hemophilia A) (F8, Accession NM\_000132) is a VGAM1666 host target gene. F8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by F8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of F8 BINDING SITE, designated SEQ ID:5615, to the nucleotide sequence of VGAM1666 RNA, herein designated VGAM RNA, also designated SEQ ID:4377.

[56281] A function of VGAM1666 is therefore inhibition of Coagulation Factor VIII, Procoagulant Component (hemophilia A) (F8, Accession NM\_000132). Accordingly, utilities of VGAM1666 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F8. Glucocorticoid Receptor DNA Binding Factor 1 (GRLF1, Accession XM\_085943) is another VGAM1666 host target

gene. GRLF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GRLF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRLF1 BINDING SITE, designated SEQ ID:38411, to the nucleotide sequence of VGAM1666 RNA, herein designated VGAM RNA, also designated SEQ ID:4377.

[56282] Another function of VGAM1666 is therefore inhibition of Glucocorticoid Receptor DNA Binding Factor 1 (GRLF1, Accession XM\_085943), a gene which inhibits transcription of the glucocorticoid receptor gene. Accordingly, utilities of VGAM1666 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRLF1. The function of GRLF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55. IRTA1 (Accession NM\_031282) is another VGAM1666 host target gene. IRTA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IRTA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IRTA1 BINDING SITE, designated SEQ ID:25302, to the nucleotide sequence of VGAM1666 RNA, herein designated VGAM RNA, also designated SEQ ID:4377.

[56283] Another function of VGAM1666 is therefore inhibition of IRTA1 (Accession NM\_031282). Accordingly, utilities of VGAM1666 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IRTA1. PR Domain Containing 2, with ZNF Domain (PRDM2, Accession NM\_012231) is another VGAM1666 host target gene. PRDM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRDM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRDM2 BINDING SITE, designated SEQ ID:14533, to the nucleotide sequence of VGAM1666 RNA, herein designated VGAM RNA, also designated SEQ ID:4377.

[56284] Another function of VGAM1666 is therefore inhibition of PR Domain Containing 2, with ZNF Domain (PRDM2, Accession NM\_012231), a gene which plays a role in tran-

scriptional regulation during neuronal differentiation and pathogenesis of retinoblastoma. Accordingly, utilities of VGAM1666 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRDM2. The function of PRDM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM120. TEM6 (Accession NM\_022748) is another VGAM1666 host target gene. TEM6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TEM6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TEM6 BINDING SITE, designated SEQ ID:22963, to the nucleotide sequence of VGAM1666 RNA, herein designated VGAM RNA, also designated SEQ ID:4377.

[56285] Another function of VGAM1666 is therefore inhibition of TEM6 (Accession NM\_022748), a gene which displays elevated expression during tumor angiogenesis. Accordingly, utilities of VGAM1666 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TEM6. The function of TEM6 and its association

with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM175. Tripartite Motif-containing 34 (TRIM34, Accession NM\_130389) is another VGAM1666 host target gene. TRIM34 BINDING SITE1 and TRIM34 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TRIM34, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM34 BINDING SITE1 and TRIM34 BINDING SITE2, designated SEQ ID:28174 and SEQ ID:22250 respectively, to the nucleotide sequence of VGAM1666 RNA, herein designated VGAM RNA, also designated SEQ ID:4377.

[56286] Another function of VGAM1666 is therefore inhibition of Tripartite Motif-containing 34 (TRIM34, Accession NM\_130389). Accordingly, utilities of VGAM1666 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM34. E2IG4 (Accession XM\_165623) is another VGAM1666 host target gene. E2IG4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by E2IG4, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of E2IG4 BINDING SITE, designated SEQ ID:43701, to the nucleotide sequence of VGAM1666 RNA, herein designated VGAM RNA, also designated SEQ ID:4377.

[56287] Another function of VGAM1666 is therefore inhibition of E2IG4 (Accession XM\_165623). Accordingly, utilities of VGAM1666 include diagnosis, prevention and treatment of diseases and clinical conditions associated with E2IG4. FLJ00001 (Accession XM\_088525) is another VGAM1666 host target gene. FLJ00001 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ00001, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ00001 BINDING SITE, designated SEQ ID:39782, to the nucleotide sequence of VGAM1666 RNA, herein designated VGAM RNA, also designated SEQ ID:4377.

[56288] Another function of VGAM1666 is therefore inhibition of FLJ00001 (Accession XM\_088525). Accordingly, utilities of VGAM1666 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ00001. KIAA0513 (Accession NM\_014732) is another VGAM1666 host target gene. KIAA0513 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0513, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0513 BINDING SITE, designated SEQ ID:16353, to the nucleotide sequence of VGAM1666 RNA, herein designated VGAM RNA, also designated SEQ ID:4377.

[56289] Another function of VGAM1666 is therefore inhibition of KIAA0513 (Accession NM\_014732). Accordingly, utilities of VGAM1666 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0513. KIAA1061 (Accession XM\_048786) is another VGAM1666 host target gene. KIAA1061 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1061, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1061 BINDING SITE, designated SEQ ID:35269, to the nucleotide sequence of VGAM1666 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4377.

[56290] Another function of VGAM1666 is therefore inhibition of KIAA1061 (Accession XM\_048786). Accordingly, utilities of VGAM1666 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1061. KIAA1297 (Accession XM\_051005) is another VGAM1666 host target gene. KIAA1297 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1297, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1297 BINDING SITE, designated SEQ ID:35715, to the nucleotide sequence of VGAM1666 RNA, herein designated VGAM RNA, also designated SEQ ID:4377.

[56291] Another function of VGAM1666 is therefore inhibition of KIAA1297 (Accession XM\_051005). Accordingly, utilities of VGAM1666 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1297. KIAA1970 (Accession XM\_058808) is another VGAM1666 host target gene. KIAA1970 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1970, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1970 BINDING SITE, designated SEQ ID:36753, to the nucleotide sequence of VGAM1666 RNA, herein designated VGAM RNA, also designated SEQ ID:4377.

[56292] Another function of VGAM1666 is therefore inhibition of KIAA1970 (Accession XM\_058808). Accordingly, utilities of VGAM1666 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1970. Lectin, Galactoside-binding, Soluble, 8 (galectin 8) (LGALS8, Accession NM\_006499) is another VGAM1666 host target gene. LGALS8 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LGALS8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LGALS8 BINDING SITE, designated SEQ ID:13245, to the nucleotide sequence of VGAM1666 RNA, herein designated VGAM RNA, also designated SEQ ID:4377.

[56293] Another function of VGAM1666 is therefore inhibition of Lectin, Galactoside-binding, Soluble, 8 (galectin 8)

(LGALS8, Accession NM\_006499). Accordingly, utilities of VGAM1666 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LGALS8. MAC30 (Accession XM\_031536) is another VGAM1666 host target gene. MAC30 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAC30, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAC30 BINDING SITE, designated SEQ ID:31403, to the nucleotide sequence of VGAM1666 RNA, herein designated VGAM RNA, also designated SEQ ID:4377.

[56294] Another function of VGAM1666 is therefore inhibition of MAC30 (Accession XM\_031536). Accordingly, utilities of VGAM1666 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAC30. MGC1136 (Accession NM\_024025) is another VGAM1666 host target gene. MGC1136 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC1136, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of MGC1136 BINDING SITE, designated SEQ ID:23454, to the nucleotide sequence of VGAM1666 RNA, herein designated VGAM RNA, also designated SEQ ID:4377.

[56295] Another function of VGAM1666 is therefore inhibition of MGC1136 (Accession NM\_024025). Accordingly, utilities of VGAM1666 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC1136. MGC12945 (Accession NM\_032318) is another VGAM1666 host target gene. MGC12945 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC12945, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC12945 BINDING SITE, designated SEQ ID:26118, to the nucleotide sequence of VGAM1666 RNA, herein designated VGAM RNA, also designated SEQ ID:4377.

[56296] Another function of VGAM1666 is therefore inhibition of MGC12945 (Accession NM\_032318). Accordingly, utilities of VGAM1666 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC12945. Sialyltransferase 8C

(alpha2,3Galbeta1,4GlcNAcalpha 2,8-sialyltransferase) (SIAT8C, Accession NM\_015879) is another VGAM1666 host target gene. SIAT8C BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SIAT8C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIAT8C BINDING SITE, designated SEQ ID:18024, to the nucleotide sequence of VGAM1666 RNA, herein designated VGAM RNA, also designated SEQ ID:4377.

[56297] Another function of VGAM1666 is therefore inhibition of Sialyltransferase 8C (alpha2,3Galbeta1,4GlcNAcalpha 2,8-sialyltransferase) (SIAT8C, Accession NM\_015879). Accordingly, utilities of VGAM1666 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIAT8C. T-cell Leukemia/lymphoma 6 (TCL6, Accession NM\_020552) is another VGAM1666 host target gene. TCL6 BINDING SITE1 through TCL6 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TCL6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of TCL6 BINDING SITE1 through TCL6 BINDING SITE4, designated SEQ ID:21765, SEQ ID:21757, SEQ ID:15763 and SEQ ID:14840 respectively, to the nucleotide sequence of VGAM1666 RNA, herein designated VGAM RNA, also designated SEQ ID:4377.

[56298] Another function of VGAM1666 is therefore inhibition of T-cell Leukemia/lymphoma 6 (TCL6, Accession NM\_020552). Accordingly, utilities of VGAM1666 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCL6. LOC199990 (Accession XM\_114083) is another VGAM1666 host target gene. LOC199990 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199990, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199990 BINDING SITE, designated SEQ ID:42684, to the nucleotide sequence of VGAM1666 RNA, herein designated VGAM RNA, also designated SEQ ID:4377.

[56299] Another function of VGAM1666 is therefore inhibition of LOC199990 (Accession XM\_114083). Accordingly, utilities

of VGAM1666 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199990. LOC201229 (Accession XM\_113925) is another VGAM1666 host target gene. LOC201229 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201229, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201229 BINDING SITE, designated SEQ ID:42544, to the nucleotide sequence of VGAM1666 RNA, herein designated VGAM RNA, also designated SEQ ID:4377.

[56300] Another function of VGAM1666 is therefore inhibition of LOC201229 (Accession XM\_113925). Accordingly, utilities of VGAM1666 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201229. LOC86651 (Accession XM\_044052) is another VGAM1666 host target gene. LOC86651 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC86651, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC86651 BINDING SITE, designated SEQ ID:34095, to the nucleotide sequence of VGAM1666 RNA, herein designated VGAM RNA, also designated SEQ ID:4377.

[56301] Another function of VGAM1666 is therefore inhibition of LOC86651 (Accession XM\_044052). Accordingly, utilities of VGAM1666 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC86651. LOC90378 (Accession XM\_031299) is another VGAM1666 host target gene. LOC90378 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90378, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90378 BINDING SITE, designated SEQ ID:31335, to the nucleotide sequence of VGAM1666 RNA, herein designated VGAM RNA, also designated SEQ ID:4377.

[56302] Another function of VGAM1666 is therefore inhibition of LOC90378 (Accession XM\_031299). Accordingly, utilities of VGAM1666 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90378. LOC91694 (Accession XM\_040082) is another VGAM1666 host target gene. LOC91694 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91694, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91694 BINDING SITE, designated SEQ ID:33248, to the nucleotide sequence of VGAM1666 RNA, herein designated VGAM RNA, also designated SEQ ID:4377.

[56303] Another function of VGAM1666 is therefore inhibition of LOC91694 (Accession XM\_040082). Accordingly, utilities of VGAM1666 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91694. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1667 (VGAM1667) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[56304] VGAM1667 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1667 was detected is described hereinabove with reference to Figs. 1-8.

[56305] VGAM1667 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Infectious Spleen and Kidney Necrosis Virus. VGAM1667 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[56306] VGAM1667 gene encodes a VGAM1667 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1667 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1667 precursor RNA is designated SEQ ID:1653, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1653 is located at position 52329 relative to the genome of Infectious Spleen and Kidney Necrosis Virus.

[56307] VGAM1667 precursor RNA folds onto itself, forming VGAM1667 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[56308] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1667 folded precursor RNA into VGAM1667 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1667 RNA is designated SEQ ID:4378, and is provided hereinbelow with reference to the sequence listing part.

[56309] VGAM1667 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1667 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1667 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[56310] VGAM1667 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1667 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1667 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1667 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1667 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[56311] The complementary binding of VGAM1667 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1667 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1667 host target RNA into VGAM1667 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[56312] It is appreciated that VGAM1667 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1667 host target genes. The mRNA of each one of this plurality of VGAM1667 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1667 RNA, herein designated VGAM RNA, and which when bound by VGAM1667 RNA causes inhibition of translation of respective one or more VGAM1667 host target proteins.

[56313] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1667 gene, herein designated VGAM GENE, on one or more VGAM1667 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[56314] It is yet further appreciated that a function of VGAM1667 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1667 include diagnosis, prevention and treatment of viral infection by Infectious Spleen and Kidney Necrosis Virus. Specific functions, and accordingly utilities, of VGAM1667 correlate with, and may be deduced from, the identity of the host target genes which VGAM1667 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[56315] Nucleotide sequences of the VGAM1667 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1667 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1667 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1667 are further described hereinbelow with reference to Table 1.

[56316] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1667 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1667 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[56317] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1667 gene, herein designated VGAM is inhibition of expression of VGAM1667 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1667 correlate with, and may be deduced from, the identity of the target genes which VGAM1667 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[56318] Dual-specificity tyrosine-(Y)-phosphorylation Regulated Kinase 1A (DYRK1A, Accession NM\_101395) is a VGAM1667 host target gene. DYRK1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DYRK1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DYRK1A BINDING SITE, designated SEQ ID:28162, to the nucleotide sequence of VGAM1667 RNA, herein designated VGAM RNA, also designated SEQ ID:4378.

[56319] A function of VGAM1667 is therefore inhibition of Dual-specificity tyrosine-(Y)-phosphorylation Regulated Kinase 1A (DYRK1A, Accession NM\_101395), a gene which regulates cell proliferation and may be involved in brain development . Accordingly, utilities of VGAM1667 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DYRK1A. The function of DYRK1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM42.Cat Eye Syndrome Chromosome Region, Candidate 7 (CECR7, Accession XM\_086803) is another VGAM1667 host target gene. CECR7 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CECR7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CECR7 BINDING SITE,

designated SEQ ID:38877, to the nucleotide sequence of VGAM1667 RNA, herein designated VGAM RNA, also designated SEQ ID:4378.

[56320] Another function of VGAM1667 is therefore inhibition of Cat Eye Syndrome Chromosome Region, Candidate 7 (CECR7, Accession XM\_086803). Accordingly, utilities of VGAM1667 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CECR7. FLJ30058 (Accession NM\_144967) is another VGAM1667 host target gene. FLJ30058 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ30058, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ30058 BINDING SITE, designated SEQ ID:29582, to the nucleotide sequence of VGAM1667 RNA, herein designated VGAM RNA, also designated SEQ ID:4378.

[56321] Another function of VGAM1667 is therefore inhibition of FLJ30058 (Accession NM\_144967). Accordingly, utilities of VGAM1667 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ30058. LOC146138 (Accession XM\_096938) is another

VGAM1667 host target gene. LOC146138 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146138, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146138 BINDING SITE, designated SEQ ID:40654, to the nucleotide sequence of VGAM1667 RNA, herein designated VGAM RNA, also designated SEQ ID:4378.

[56322] Another function of VGAM1667 is therefore inhibition of LOC146138 (Accession XM\_096938). Accordingly, utilities of VGAM1667 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146138. LOC146443 (Accession XM\_085461) is another VGAM1667 host target gene. LOC146443 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146443, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146443 BINDING SITE, designated SEQ ID:38148, to the nucleotide sequence of VGAM1667 RNA, herein designated VGAM RNA, also designated SEQ ID:4378.

[56323] Another function of VGAM1667 is therefore inhibition of LOC146443 (Accession XM\_085461). Accordingly, utilities of VGAM1667 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146443. LOC221922 (Accession XM\_166555) is another VGAM1667 host target gene. LOC221922 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221922, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221922 BINDING SITE, designated SEQ ID:44531, to the nucleotide sequence of VGAM1667 RNA, herein designated VGAM RNA, also designated SEQ ID:4378.

[56324] Another function of VGAM1667 is therefore inhibition of LOC221922 (Accession XM\_166555). Accordingly, utilities of VGAM1667 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221922. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1668 (VGAM1668) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[56325] VGAM1668 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1668 was detected is described hereinabove with reference to Figs. 1–8.

[56326] VGAM1668 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Adenovirus D. VGAM1668 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[56327] VGAM1668 gene encodes a VGAM1668 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1668 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1668 precursor RNA is designated SEQ ID:1654, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1654 is located at position 20850 relative to the genome of Human Adenovirus D.

[56328] VGAM1668 precursor RNA folds onto itself, forming VGAM1668 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[56329] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1668 folded precursor RNA into VGAM1668 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM1668 RNA is designated SEQ ID:4379, and is provided hereinbelow with reference to the sequence listing part.

[56330] VGAM1668 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1668 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1668 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[56331] VGAM1668 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1668 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1668 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1668 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1668 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[56332] The complementary binding of VGAM1668 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1668 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1668 host target RNA into VGAM1668 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[56333] It is appreciated that VGAM1668 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1668 host target genes. The mRNA of each one of this plurality of VGAM1668 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1668 RNA, herein designated VGAM RNA, and which when bound by VGAM1668 RNA causes inhibition of translation of respective one or more VGAM1668 host target proteins.

[56334] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1668 gene, herein designated VGAM GENE, on one or more VGAM1668 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[56335] It is yet further appreciated that a function of VGAM1668 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1668 include diagnosis, prevention and treatment of viral infection by Human Adenovirus D. Specific functions, and accordingly utilities, of VGAM1668 correlate with, and may be deduced from, the identity of the host target genes which VGAM1668 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[56336] Nucleotide sequences of the VGAM1668 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1668 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1668 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1668 are further described hereinbelow with reference to Table 1.

[56337] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1668 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1668 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[56338] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1668 gene, herein designated VGAM is inhibition of expression of VGAM1668 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1668 correlate with, and may be deduced from, the identity of the target genes which VGAM1668 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[56339] AXL Receptor Tyrosine Kinase (AXL, Accession NM\_001699) is a VGAM1668 host target gene. AXL BINDING SITE1 and AXL BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by AXL, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AXL BINDING SITE1 and AXL BINDING SITE2, designated SEQ ID:7422 and SEQ ID:22443 respectively, to the nucleotide sequence of VGAM1668 RNA, herein designated VGAM RNA, also designated SEQ ID:4379.

[56340] A function of VGAM1668 is therefore inhibition of AXL Receptor Tyrosine Kinase (AXL, Accession NM\_001699). Accordingly, utilities of VGAM1668 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AXL. Frizzled Homolog 4 (Drosophila) (FZD4, Accession NM\_012193) is another VGAM1668 host target gene. FZD4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FZD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FZD4 BINDING SITE, designated SEQ

ID:14483, to the nucleotide sequence of VGAM1668 RNA, herein designated VGAM RNA, also designated SEQ ID:4379.

[56341] Another function of VGAM1668 is therefore inhibition of Frizzled Homolog 4 (Drosophila) (FZD4, Accession NM\_012193), a gene which may function in cell polarity, cell fate specification and cancer; similar to frizzled receptor family, has seven transmembrane domains. Accordingly, utilities of VGAM1668 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FZD4. The function of FZD4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM309.Glucose-6-phosphatase, Transport (glucose-6-phosphate) Protein 1 (G6PT1, Accession NM\_001467) is another VGAM1668 host target gene. G6PT1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by G6PT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of G6PT1 BINDING SITE, designated SEQ ID:7199,

to the nucleotide sequence of VGAM1668 RNA, herein designated VGAM RNA, also designated SEQ ID:4379.

[56342] Another function of VGAM1668 is therefore inhibition of Glucose-6-phosphatase, Transport (glucose-6-phosphate) Protein 1 (G6PT1, Accession NM\_001467). Accordingly, utilities of VGAM1668 include diagnosis, prevention and treatment of diseases and clinical conditions associated with G6PT1. Potassium Intermediate/small Conductance Calcium-activated Channel, Subfamily N, Member 4 (KCNN4, Accession NM\_002250) is another VGAM1668 host target gene. KCNN4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KCNN4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNN4 BINDING SITE, designated SEQ ID:8037, to the nucleotide sequence of VGAM1668 RNA, herein designated VGAM RNA, also designated SEQ ID:4379.

[56343] Another function of VGAM1668 is therefore inhibition of Potassium Intermediate/small Conductance Calcium-activated Channel, Subfamily N, Member 4 (KCNN4, Accession NM\_002250), a gene which forms a voltage-in-

dependent potassium channel that is activated by intracellular calcium. Accordingly, utilities of VGAM1668 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNN4. The function of KCNN4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM152. Methionine Adenosyltransferase I, Alpha (MAT1A, Accession XM\_165540) is another VGAM1668 host target gene. MAT1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAT1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAT1A BINDING SITE, designated SEQ ID:43668, to the nucleotide sequence of VGAM1668 RNA, herein designated VGAM RNA, also designated SEQ ID:4379.

[56344] Another function of VGAM1668 is therefore inhibition of Methionine Adenosyltransferase I, Alpha (MAT1A, Accession XM\_165540). Accordingly, utilities of VGAM1668 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAT1A. Neuroblastoma

RAS Viral (v-ras) Oncogene Homolog (NRAS, Accession NM\_002524) is another VGAM1668 host target gene. NRAS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NRAS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NRAS BINDING SITE, designated SEQ ID:8360, to the nucleotide sequence of VGAM1668 RNA, herein designated VGAM RNA, also designated SEQ ID:4379.

[56345] Another function of VGAM1668 is therefore inhibition of Neuroblastoma RAS Viral (v-ras) Oncogene Homolog (NRAS, Accession NM\_002524), a gene which ras proteins bind gdp/gtp and possess intrinsic gtpase activity. Accordingly, utilities of VGAM1668 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NRAS. The function of NRAS and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM351. Secreted Frizzled-related Protein 1 (SFRP1, Accession NM\_003012) is another VGAM1668 host target gene. SFRP1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region

of mRNA encoded by SFRP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFRP1 BINDING SITE, designated SEQ ID:8929, to the nucleotide sequence of VGAM1668 RNA, herein designated VGAM RNA, also designated SEQ ID:4379.

[56346] Another function of VGAM1668 is therefore inhibition of Secreted Frizzled-related Protein 1 (SFRP1, Accession NM\_003012), a gene which is a receptor for wnt proteins that may have an anti-apoptotic function. Accordingly, utilities of VGAM1668 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFRP1. The function of SFRP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM250.FLJ10101 (Accession NM\_024718) is another VGAM1668 host target gene. FLJ10101 BINDING SITE1 and FLJ10101 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ10101, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the

nucleotide sequences of FLJ10101 BINDING SITE1 and FLJ10101 BINDING SITE2, designated SEQ ID:24045 and SEQ ID:24046 respectively, to the nucleotide sequence of VGAM1668 RNA, herein designated VGAM RNA, also designated SEQ ID:4379.

[56347] Another function of VGAM1668 is therefore inhibition of FLJ10101 (Accession NM\_024718). Accordingly, utilities of VGAM1668 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10101. KIAA0285 (Accession NM\_014807) is another VGAM1668 host target gene. KIAA0285 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0285, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0285 BINDING SITE, designated SEQ ID:16752, to the nucleotide sequence of VGAM1668 RNA, herein designated VGAM RNA, also designated SEQ ID:4379.

[56348] Another function of VGAM1668 is therefore inhibition of KIAA0285 (Accession NM\_014807). Accordingly, utilities of VGAM1668 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0285. KIAA0350 (Accession XM\_028332) is another VGAM1668 host target gene. KIAA0350 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0350, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0350 BINDING SITE, designated SEQ ID:30665, to the nucleotide sequence of VGAM1668 RNA, herein designated VGAM RNA, also designated SEQ ID:4379.

[56349] Another function of VGAM1668 is therefore inhibition of KIAA0350 (Accession XM\_028332). Accordingly, utilities of VGAM1668 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0350. KIAA0669 (Accession NM\_014779) is another VGAM1668 host target gene. KIAA0669 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0669, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0669 BINDING SITE, designated SEQ ID:16626, to the nucleotide sequence of VGAM1668 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4379.

[56350] Another function of VGAM1668 is therefore inhibition of KIAA0669 (Accession NM\_014779). Accordingly, utilities of VGAM1668 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0669. KIAA0731 (Accession XM\_039975) is another VGAM1668 host target gene. KIAA0731 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0731, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0731 BINDING SITE, designated SEQ ID:33239, to the nucleotide sequence of VGAM1668 RNA, herein designated VGAM RNA, also designated SEQ ID:4379.

[56351] Another function of VGAM1668 is therefore inhibition of KIAA0731 (Accession XM\_039975). Accordingly, utilities of VGAM1668 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0731. KIAA0872 (Accession NM\_014940) is another VGAM1668 host target gene. KIAA0872 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0872, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0872 BINDING SITE, designated SEQ ID:17245, to the nucleotide sequence of VGAM1668 RNA, herein designated VGAM RNA, also designated SEQ ID:4379.

[56352] Another function of VGAM1668 is therefore inhibition of KIAA0872 (Accession NM\_014940). Accordingly, utilities of VGAM1668 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0872. KIAA1172 (Accession XM\_047889) is another VGAM1668 host target gene. KIAA1172 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1172, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1172 BINDING SITE, designated SEQ ID:35078, to the nucleotide sequence of VGAM1668 RNA, herein designated VGAM RNA, also designated SEQ ID:4379.

[56353] Another function of VGAM1668 is therefore inhibition of KIAA1172 (Accession XM\_047889). Accordingly, utilities of VGAM1668 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1172. LOC116411 (Accession XM\_058095) is another VGAM1668 host target gene. LOC116411 BINDING SITE1 through LOC116411 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC116411, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC116411 BINDING SITE1 through LOC116411 BINDING SITE3, designated SEQ ID:36566, SEQ ID:36567 and SEQ ID:36572 respectively, to the nucleotide sequence of VGAM1668 RNA, herein designated VGAM RNA, also designated SEQ ID:4379.

[56354] Another function of VGAM1668 is therefore inhibition of LOC116411 (Accession XM\_058095). Accordingly, utilities of VGAM1668 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116411. LOC152762 (Accession XM\_087518) is another VGAM1668 host target gene. LOC152762 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152762, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC152762 BINDING SITE, designated SEQ ID:39305, to the nucleotide sequence of VGAM1668 RNA, herein designated VGAM RNA, also designated SEQ ID:4379.

[56355] Another function of VGAM1668 is therefore inhibition of LOC152762 (Accession XM\_087518). Accordingly, utilities of VGAM1668 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152762. LOC200093 (Accession XM\_032184) is another VGAM1668 host target gene. LOC200093 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200093, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200093 BINDING SITE, designated SEQ ID:31598, to the nucleotide sequence of VGAM1668 RNA, herein designated VGAM RNA, also designated SEQ ID:4379.

[56356] Another function of VGAM1668 is therefore inhibition of LOC200093 (Accession XM\_032184). Accordingly, utilities of VGAM1668 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200093. LOC221468 (Accession NM\_145316) is an-

other VGAM1668 host target gene. LOC221468 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221468, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221468 BINDING SITE, designated SEQ ID:29826, to the nucleotide sequence of VGAM1668 RNA, herein designated VGAM RNA, also designated SEQ ID:4379.

[56357] Another function of VGAM1668 is therefore inhibition of LOC221468 (Accession NM\_145316). Accordingly, utilities of VGAM1668 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221468. LOC92697 (Accession XM\_046715) is another VGAM1668 host target gene. LOC92697 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92697, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92697 BINDING SITE, designated SEQ ID:34806, to the nucleotide sequence of VGAM1668 RNA, herein designated VGAM RNA, also designated SEQ ID:4379.

[56358] Another function of VGAM1668 is therefore inhibition of LOC92697 (Accession XM\_046715). Accordingly, utilities of VGAM1668 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92697. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1669 (VGAM1669) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[56359] VGAM1669 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1669 was detected is described hereinabove with reference to Figs. 1–8.

[56360] VGAM1669 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Adenovirus D. VGAM1669 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[56361] VGAM1669 gene encodes a VGAM1669 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM1669 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1669 precursor RNA is designated SEQ ID:1655, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1655 is located at position 18504 relative to the genome of Human Adenovirus D.

[56362] VGAM1669 precursor RNA folds onto itself, forming VGAM1669 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[56363] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1669 folded precursor RNA into VGAM1669 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1669 RNA is designated SEQ ID:4380, and is provided hereinbelow with reference to the sequence listing part.

[56364] VGAM1669 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1669 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1669 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[56365] VGAM1669 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1669 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1669 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1669 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1669 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[56366] The complementary binding of VGAM1669 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1669 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1669 host target RNA into VGAM1669 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[56367] It is appreciated that VGAM1669 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1669 host target genes. The mRNA of each one of this plurality of VGAM1669 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1669 RNA, herein designated VGAM RNA, and which when bound by VGAM1669 RNA causes inhibition of translation of respective one or more VGAM1669 host target proteins.

[56368] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1669 gene, herein designated VGAM GENE, on one or more VGAM1669 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[56369] It is yet further appreciated that a function of VGAM1669 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1669 include diagnosis, prevention and treatment of viral infection by Human Adenovirus D. Specific functions, and accordingly utilities, of VGAM1669 correlate with, and may be deduced from, the identity of the host target genes which VGAM1669 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[56370] Nucleotide sequences of the VGAM1669 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1669 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1669 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1669 are further described hereinbelow with reference to Table 1.

[56371] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1669 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1669 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[56372] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1669 gene, herein designated VGAM is inhibition of expression of VGAM1669 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1669 correlate with, and may be deduced from, the identity of the target genes which VGAM1669 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[56373] Carnitine O-octanoyltransferase (CROT, Accession NM\_021151) is a VGAM1669 host target gene. CROT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CROT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CROT BINDING SITE, designated SEQ ID:22123, to the nucleotide sequence of VGAM1669 RNA, herein designated VGAM RNA, also designated SEQ ID:4380.

[56374] A function of VGAM1669 is therefore inhibition of Carnitine O-octanoyltransferase (CROT, Accession NM\_021151), a gene which CROT plays a crucial role in the beta-oxidation of branched-chain fatty acids includ-

ing pristanic acid. Accordingly, utilities of VGAM1669 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CROT. The function of CROT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM70. Eukaryotic Translation Initiation Factor 4E Binding Protein 2 (EIF4EBP2, Accession NM\_004096) is another VGAM1669 host target gene. EIF4EBP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EIF4EBP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF4EBP2 BINDING SITE, designated SEQ ID:10300, to the nucleotide sequence of VGAM1669 RNA, herein designated VGAM RNA, also designated SEQ ID:4380.

[56375] Another function of VGAM1669 is therefore inhibition of Eukaryotic Translation Initiation Factor 4E Binding Protein 2 (EIF4EBP2, Accession NM\_004096), a gene which binds EIF4E and negatively regulates initiation of translation. Accordingly, utilities of VGAM1669 include diagnosis, prevention and treatment of diseases and clinical condi-

tions associated with EIF4EBP2. The function of EIF4EBP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM501.G Protein-coupled Receptor 44 (GPR44, Accession NM\_004778) is another VGAM1669 host target gene. GPR44 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPR44, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPR44 BINDING SITE, designated SEQ ID:11173, to the nucleotide sequence of VGAM1669 RNA, herein designated VGAM RNA, also designated SEQ ID:4380.

[56376] Another function of VGAM1669 is therefore inhibition of G Protein-coupled Receptor 44 (GPR44, Accession NM\_004778), a gene which mediates signals to the interior of the cell via activation of heterotrimeric G proteins . Accordingly, utilities of VGAM1669 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR44. The function of GPR44 has been established by previous studies. By PCR amplification of human genomic DNA using degenerate oligonu-

cleotides corresponding to transmembrane domains 3 and 7 of the mouse delta-opioid receptor and somatostatin receptors, Marchese et al. (1999) isolated a partial cDNA for a novel G protein-coupled receptor, which they designated GPR44. They obtained a full-length clone by screening a lambda human genomic library. GPR44 encodes a 472-amino acid protein that is closely related to chemoattractant receptors. Northern blot analysis revealed a 3.5-kb GPR44 transcript primarily in thalamus, frontal cortex, pons, and hippocampus and at lower levels in hypothalamus and caudate/putamen. A 3.4-kb transcript was detected in fetal liver, leukocytes, and thymus. Prostaglandin D2 (PGD2; OMIM Ref. No. 176803) and other prostanoids are synthesized by the constitutive cyclooxygenase COX1 (PTGS1; 176805) and its inducible isoform, COX2 (PTGS2; 600262). PGD2, which is implicated in allergic disease, elicits its biologic function through interaction with the DP receptor (PTGDR; 604687). Hirai et al. (2001) showed that PGD2 produced by activated mast cells uses CRTH2 to induce intracellular calcium mobilization and chemotaxis in Th2 cells in a G-alpha(i) (GNAI1; 139310)-dependent manner. In addition, they found that CRTH2 rather than DP mediates

PGD2-dependent migration of blood eosinophils and basophils. Functional analysis indicated that PGD2 signaling through DP is coupled to G-alpha(s) (GNAS; 139320) and does not induce chemotaxis.

[56377] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[56378] Hirai, H.; Tanaka, K.; Yoshie, O.; Ogawa, K.; Kenmotsu, K.; Takamori, Y.; Ichimasa, M.; Sugamura, K.; Nakamura, M.; Takano, S.; Nagata, K. : Prostaglandin D2 selectively induces chemotaxis in T helper type 2 cells, eosinophils, and basophils via seven-transmembrane receptor CRTH2. J. Exp. Med. 193: 255-261, 2001. ; and

[56379] Marchese, A.; Sawzdargo, M.; Nguyen, T.; Cheng, R.; Heng, H. H. Q.; Nowak, T.; Im, D-S.; Lynch, K. R.; George, S. R.; O'Dowd, B. F. : Discovery of three novel orphan G-protein-coupled r.

[56380] Further studies establishing the function and utilities of GPR44 are found in John Hopkins OMIM database record ID 604837, and in cited publications numbered 694 and 9159 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DKFZP434O047 (Accession NM\_015594) is another VGAM1669 host target

gene. DKFZP434O047 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP434O047, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434O047 BINDING SITE, designated SEQ ID:17868, to the nucleotide sequence of VGAM1669 RNA, herein designated VGAM RNA, also designated SEQ ID:4380.

[56381] Another function of VGAM1669 is therefore inhibition of DKFZP434O047 (Accession NM\_015594). Accordingly, utilities of VGAM1669 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434O047. FLJ20716 (Accession NM\_017938) is another VGAM1669 host target gene. FLJ20716 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20716, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20716 BINDING SITE, designated SEQ ID:19631, to the nucleotide sequence of VGAM1669 RNA, herein designated VGAM RNA, also designated SEQ ID:4380.

[56382] Another function of VGAM1669 is therefore inhibition of FLJ20716 (Accession NM\_017938). Accordingly, utilities of VGAM1669 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20716. Heterogeneous Nuclear Ribonucleoprotein A3 (HNRPA3, Accession NM\_005758) is another VGAM1669 host target gene. HNRPA3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HNRPA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HNRPA3 BINDING SITE, designated SEQ ID:12322, to the nucleotide sequence of VGAM1669 RNA, herein designated VGAM RNA, also designated SEQ ID:4380.

[56383] Another function of VGAM1669 is therefore inhibition of Heterogeneous Nuclear Ribonucleoprotein A3 (HNRPA3, Accession NM\_005758). Accordingly, utilities of VGAM1669 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HNRPA3. MAGE-E1 (Accession NM\_030801) is another VGAM1669 host target gene. MAGE-E1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by MAGE-E1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAGE-E1 BINDING SITE, designated SEQ ID:25103, to the nucleotide sequence of VGAM1669 RNA, herein designated VGAM RNA, also designated SEQ ID:4380.

[56384] Another function of VGAM1669 is therefore inhibition of MAGE-E1 (Accession NM\_030801). Accordingly, utilities of VGAM1669 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAGE-E1. Mal, T-cell Differentiation Protein 2 (MAL2, Accession NM\_052886) is another VGAM1669 host target gene. MAL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAL2 BINDING SITE, designated SEQ ID:27469, to the nucleotide sequence of VGAM1669 RNA, herein designated VGAM RNA, also designated SEQ ID:4380.

[56385] Another function of VGAM1669 is therefore inhibition of Mal, T-cell Differentiation Protein 2 (MAL2, Accession

NM\_052886). Accordingly, utilities of VGAM1669 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAL2. MGC15563 (Accession NM\_032876) is another VGAM1669 host target gene. MGC15563 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC15563, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC15563 BINDING SITE, designated SEQ ID:26699, to the nucleotide sequence of VGAM1669 RNA, herein designated VGAM RNA, also designated SEQ ID:4380.

[56386] Another function of VGAM1669 is therefore inhibition of MGC15563 (Accession NM\_032876). Accordingly, utilities of VGAM1669 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15563. LOC204823 (Accession XM\_115621) is another VGAM1669 host target gene. LOC204823 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC204823, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC204823 BINDING SITE, designated SEQ ID:43102, to the nucleotide sequence of VGAM1669 RNA, herein designated VGAM RNA, also designated SEQ ID:4380.

[56387] Another function of VGAM1669 is therefore inhibition of LOC204823 (Accession XM\_115621). Accordingly, utilities of VGAM1669 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC204823. LOC255654 (Accession XM\_173036) is another VGAM1669 host target gene. LOC255654 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255654, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255654 BINDING SITE, designated SEQ ID:46302, to the nucleotide sequence of VGAM1669 RNA, herein designated VGAM RNA, also designated SEQ ID:4380.

[56388] Another function of VGAM1669 is therefore inhibition of LOC255654 (Accession XM\_173036). Accordingly, utilities of VGAM1669 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255654. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1670 (VGAM1670) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[56389] VGAM1670 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1670 was detected is described hereinabove with reference to Figs. 1–8.

[56390] VGAM1670 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Adenovirus D. VGAM1670 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[56391] VGAM1670 gene encodes a VGAM1670 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1670 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1670 precursor RNA is designated SEQ ID:1656, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:1656 is located at position 16692 relative to the genome of Human Adenovirus D.

[56392] VGAM1670 precursor RNA folds onto itself, forming VGAM1670 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[56393] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1670 folded precursor RNA into VGAM1670 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1670 RNA is designated SEQ ID:4381, and is provided hereinbelow with reference to the sequence listing part.

[56394] VGAM1670 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1670 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1670 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[56395] VGAM1670 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1670 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1670 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1670 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1670 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[56396] The complementary binding of VGAM1670 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1670 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1670 host target RNA into VGAM1670 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[56397] It is appreciated that VGAM1670 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1670 host target genes. The mRNA of each one of this plurality of VGAM1670 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1670 RNA, herein designated VGAM RNA, and which when bound by VGAM1670 RNA causes inhibition of translation of respective one or more

VGAM1670 host target proteins.

[56398] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1670 gene, herein designated VGAM GENE, on one or more VGAM1670 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[56399] It is yet further appreciated that a function of VGAM1670 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1670 include diagnosis, prevention and treatment of viral infection by Human Adenovirus D. Spe-

cific functions, and accordingly utilities, of VGAM1670 correlate with, and may be deduced from, the identity of the host target genes which VGAM1670 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[56400] Nucleotide sequences of the VGAM1670 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1670 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1670 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1670 are further described hereinbelow with reference to Table 1.

[56401] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1670 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1670 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[56402] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1670 gene, herein designated VGAM is inhibition of expression of VGAM1670 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM1670 correlate with, and may be deduced from, the identity of the target genes which VGAM1670 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[56403] A Disintegrin and Metalloproteinase Domain 19 (meltrin beta) (ADAM19, Accession NM\_033274) is a VGAM1670 host target gene. ADAM19 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADAM19, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAM19 BINDING SITE, designated SEQ ID:27095, to the nucleotide sequence of VGAM1670 RNA, herein designated VGAM RNA, also designated SEQ ID:4381.

[56404] A function of VGAM1670 is therefore inhibition of A Disintegrin and Metalloproteinase Domain 19 (meltrin beta) (ADAM19, Accession NM\_033274), a gene which participates in the proteolytic processing of beta-type neuregulin isoforms . Accordingly, utilities of VGAM1670 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAM19. The function of ADAM19 and its association with various diseases and

clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM179. Adaptor-related Protein Complex 2, Beta 1 Subunit (AP2B1, Accession NM\_001282) is another VGAM1670 host target gene. AP2B1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AP2B1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AP2B1 BINDING SITE, designated SEQ ID:6953, to the nucleotide sequence of VGAM1670 RNA, herein designated VGAM RNA, also designated SEQ ID:4381.

[56405] Another function of VGAM1670 is therefore inhibition of Adaptor-related Protein Complex 2, Beta 1 Subunit (AP2B1, Accession NM\_001282), a gene which links clathrin to receptors in coated vesicles. Accordingly, utilities of VGAM1670 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP2B1. The function of AP2B1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1126. Bone Morphogenetic Protein

Receptor, Type II (serine/threonine kinase) (BMP2, Accession NM\_001204) is another VGAM1670 host target gene. BMP2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by BMP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BMP2 BINDING SITE, designated SEQ ID:6869, to the nucleotide sequence of VGAM1670 RNA, herein designated VGAM RNA, also designated SEQ ID:4381.

[56406] Another function of VGAM1670 is therefore inhibition of Bone Morphogenetic Protein Receptor, Type II (serine/threonine kinase) (BMP2, Accession NM\_001204). Accordingly, utilities of VGAM1670 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BMP2. Cytochrome P450, Subfamily IVF, Polypeptide 3 (leukotriene B4 omega hydroxylase) (CYP4F3, Accession NM\_000896) is another VGAM1670 host target gene. CYP4F3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CYP4F3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP4F3 BINDING SITE, designated SEQ ID:6592, to the nucleotide sequence of VGAM1670 RNA, herein designated VGAM RNA, also designated SEQ ID:4381.

[56407] Another function of VGAM1670 is therefore inhibition of Cytochrome P450, Subfamily IVF, Polypeptide 3 (leukotriene B4 omega hydroxylase) (CYP4F3, Accession NM\_000896), a gene which converts leukotriene B4 into the less active 20-hydroxy-leukotriene B4. Accordingly, utilities of VGAM1670 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP4F3. The function of CYP4F3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM186. Exostoses (multiple)-like 1 (EXTL1, Accession NM\_004455) is another VGAM1670 host target gene. EXTL1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EXTL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EXTL1 BINDING SITE, des-

ignated SEQ ID:10752, to the nucleotide sequence of VGAM1670 RNA, herein designated VGAM RNA, also designated SEQ ID:4381.

[56408] Another function of VGAM1670 is therefore inhibition of Exostoses (multiple)-like 1 (EXTL1, Accession NM\_004455), a gene which probably contribute to the synthesis of heparan sulfate and heparin. Accordingly, utilities of VGAM1670 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EXTL1. The function of EXTL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM806. Interleukin 1 Family, Member 5 (delta) (IL1F5, Accession NM\_012275) is another VGAM1670 host target gene. IL1F5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL1F5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL1F5 BINDING SITE, designated SEQ ID:14598, to the nucleotide sequence of VGAM1670 RNA, herein designated VGAM RNA, also designated SEQ ID:4381.

[56409] Another function of VGAM1670 is therefore inhibition of Interleukin 1 Family, Member 5 (delta) (IL1F5, Accession NM\_012275), a gene which is a novel interleukin-1 receptor antagonist gene. Accordingly, utilities of VGAM1670 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL1F5. The function of IL1F5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM263. Oligophrenin 1 (OPHN1, Accession NM\_002547) is another VGAM1670 host target gene. OPHN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OPHN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OPHN1 BINDING SITE, designated SEQ ID:8402, to the nucleotide sequence of VGAM1670 RNA, herein designated VGAM RNA, also designated SEQ ID:4381.

[56410] Another function of VGAM1670 is therefore inhibition of Oligophrenin 1 (OPHN1, Accession NM\_002547). Accordingly, utilities of VGAM1670 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with OPHN1. Periaxin (PRX, Accession NM\_020956) is another VGAM1670 host target gene. PRX BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRX BINDING SITE, designated SEQ ID:21934, to the nucleotide sequence of VGAM1670 RNA, herein designated VGAM RNA, also designated SEQ ID:4381.

[56411] Another function of VGAM1670 is therefore inhibition of Periaxin (PRX, Accession NM\_020956), a gene which seems to be required for maintenance of peripheral nerve myelin sheath. may have a role in axon-glial interactions, possibly by interacting with the cytoplasmic domains of integral membrane proteins such as myelin-associated glycoprotein in the periaxonal regions of the schwann cell plasma membrane. may have a role in the early phases of myelin deposition. Accordingly, utilities of VGAM1670 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRX. The function of PRX and its association with various diseases and clinical conditions, has been established by previous studies, as

described hereinabove with reference to VGAM476. Zinc Finger Protein 192 (ZNF192, Accession NM\_006298) is another VGAM1670 host target gene. ZNF192 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF192, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF192 BINDING SITE, designated SEQ ID:12990, to the nucleotide sequence of VGAM1670 RNA, herein designated VGAM RNA, also designated SEQ ID:4381.

[56412] Another function of VGAM1670 is therefore inhibition of Zinc Finger Protein 192 (ZNF192, Accession NM\_006298). Accordingly, utilities of VGAM1670 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF192. H-L(3)MBT (Accession NM\_015478) is another VGAM1670 host target gene. H-L(3)MBT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by H-L(3)MBT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of H-L(3)MBT BINDING SITE, designated SEQ

ID:17755, to the nucleotide sequence of VGAM1670 RNA, herein designated VGAM RNA, also designated SEQ ID:4381.

[56413] Another function of VGAM1670 is therefore inhibition of H-L(3)MBT (Accession NM\_015478). Accordingly, utilities of VGAM1670 include diagnosis, prevention and treatment of diseases and clinical conditions associated with H-L(3)MBT. KIAA1456 (Accession XM\_040100) is another VGAM1670 host target gene. KIAA1456 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1456, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1456 BINDING SITE, designated SEQ ID:33264, to the nucleotide sequence of VGAM1670 RNA, herein designated VGAM RNA, also designated SEQ ID:4381.

[56414] Another function of VGAM1670 is therefore inhibition of KIAA1456 (Accession XM\_040100). Accordingly, utilities of VGAM1670 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1456. SZF1 (Accession NM\_016089) is another VGAM1670 host target gene. SZF1 BINDING SITE is HOST

TARGET binding site found in the 5` untranslated region of mRNA encoded by SZF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SZF1 BINDING SITE, designated SEQ ID:18175, to the nucleotide sequence of VGAM1670 RNA, herein designated VGAM RNA, also designated SEQ ID:4381.

[56415] Another function of VGAM1670 is therefore inhibition of SZF1 (Accession NM\_016089). Accordingly, utilities of VGAM1670 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SZF1. LOC146243 (Accession XM\_096956) is another VGAM1670 host target gene. LOC146243 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC146243, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146243 BINDING SITE, designated SEQ ID:40679, to the nucleotide sequence of VGAM1670 RNA, herein designated VGAM RNA, also designated SEQ ID:4381.

[56416] Another function of VGAM1670 is therefore inhibition of

LOC146243 (Accession XM\_096956). Accordingly, utilities of VGAM1670 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146243. LOC257117 (Accession XM\_171238) is another VGAM1670 host target gene. LOC257117 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257117, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257117 BINDING SITE, designated SEQ ID:46025, to the nucleotide sequence of VGAM1670 RNA, herein designated VGAM RNA, also designated SEQ ID:4381.

[56417] Another function of VGAM1670 is therefore inhibition of LOC257117 (Accession XM\_171238). Accordingly, utilities of VGAM1670 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257117. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1671 (VGAM1671) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[56418] VGAM1671 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1671 was detected is described hereinabove with reference to Figs. 1–8.

[56419] VGAM1671 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Adenovirus D. VGAM1671 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[56420] VGAM1671 gene encodes a VGAM1671 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1671 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1671 precursor RNA is designated SEQ ID:1657, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1657 is located at position 13911 relative to the genome of Human Adenovirus D.

[56421] VGAM1671 precursor RNA folds onto itself, forming VGAM1671 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two–

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[56422] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1671 folded precursor RNA into VGAM1671 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1671 RNA is designated SEQ ID:4382, and is provided hereinbelow with reference to the sequence listing part.

[56423] VGAM1671 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1671 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1671 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[56424] VGAM1671 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1671 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1671 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1671 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1671 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[56425] The complementary binding of VGAM1671 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1671 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1671 host target RNA into VGAM1671 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[56426] It is appreciated that VGAM1671 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1671 host target genes. The mRNA of each one of this plurality of VGAM1671 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1671 RNA, herein designated VGAM RNA, and which when bound by VGAM1671 RNA causes inhibition of translation of respective one or more VGAM1671 host target proteins.

[56427] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1671 gene, herein designated VGAM GENE, on one

or more VGAM1671 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[56428] It is yet further appreciated that a function of VGAM1671 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1671 include diagnosis, prevention and treatment of viral infection by Human Adenovirus D. Specific functions, and accordingly utilities, of VGAM1671 correlate with, and may be deduced from, the identity of the host target genes which VGAM1671 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[56429] Nucleotide sequences of the VGAM1671 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1671 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1671 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1671 are further described hereinbelow with reference to Table 1.

[56430] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1671 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1671 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[56431] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1671 gene, herein designated VGAM is inhibition of expression of VGAM1671 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1671 correlate with, and may be deduced from, the identity of the target genes which VGAM1671 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[56432] CRACC (Accession NM\_021181) is a VGAM1671 host tar-

get gene. CRACC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CRACC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRACC BINDING SITE, designated SEQ ID:22157, to the nucleotide sequence of VGAM1671 RNA, herein designated VGAM RNA, also designated SEQ ID:4382.

[56433] A function of VGAM1671 is therefore inhibition of CRACC (Accession NM\_021181), a gene which may participate in adhesion reactions between T lymphocytes and accessory cells. Accordingly, utilities of VGAM1671 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRACC. The function of CRACC and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM26.DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 11 (CHL1-like helicase homolog, *S. cerevisiae*) (DDX11, Accession NM\_030655) is another VGAM1671 host target gene. DDX11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

DDX11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDX11 BINDING SITE, designated SEQ ID:24987, to the nucleotide sequence of VGAM1671 RNA, herein designated VGAM RNA, also designated SEQ ID:4382.

[56434] Another function of VGAM1671 is therefore inhibition of DEAD/H (Asp–Glu–Ala–Asp/His) Box Polypeptide 11 (CHL1–like helicase homolog, *S. cerevisiae*) (DDX11, Accession NM\_030655), a gene which could be an ATP–dependent DNA–binding helicase and may intervene in cell cycle regulation. Accordingly, utilities of VGAM1671 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX11. The function of DDX11 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1533.24–dehydrocholesterol Reductase (DHCR24, Accession NM\_014762) is another VGAM1671 host target gene. DHCR24 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DHCR24, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DHCR24 BINDING SITE, designated SEQ ID:16524, to the nucleotide sequence of VGAM1671 RNA, herein designated VGAM RNA, also designated SEQ ID:4382.

[56435] Another function of VGAM1671 is therefore inhibition of 24-dehydrocholesterol Reductase (DHCR24, Accession NM\_014762), a gene which catalyzes the reduction of sterol intermediates. Accordingly, utilities of VGAM1671 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DHCR24. The function of DHCR24 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM235. Dystrophia Myotonica-protein Kinase (DMPK, Accession NM\_004409) is another VGAM1671 host target gene. DMPK BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DMPK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DMPK BINDING SITE, designated SEQ ID:10668,

to the nucleotide sequence of VGAM1671 RNA, herein designated VGAM RNA, also designated SEQ ID:4382.

[56436] Another function of VGAM1671 is therefore inhibition of Dystrophia Myotonica-protein Kinase (DMPK, Accession NM\_004409). Accordingly, utilities of VGAM1671 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DMPK. Dual Specificity Phosphatase 4 (DUSP4, Accession NM\_057158) is another VGAM1671 host target gene. DUSP4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DUSP4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DUSP4 BINDING SITE, designated SEQ ID:27668, to the nucleotide sequence of VGAM1671 RNA, herein designated VGAM RNA, also designated SEQ ID:4382.

[56437] Another function of VGAM1671 is therefore inhibition of Dual Specificity Phosphatase 4 (DUSP4, Accession NM\_057158), a gene which regulates mitogenic signal transduction. Accordingly, utilities of VGAM1671 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DUSP4. The function of

DUSP4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM110.GASC1 (Accession XM\_034624) is another VGAM1671 host target gene. GASC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GASC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GASC1 BINDING SITE, designated SEQ ID:32125, to the nucleotide sequence of VGAM1671 RNA, herein designated VGAM RNA, also designated SEQ ID:4382.

[56438] Another function of VGAM1671 is therefore inhibition of GASC1 (Accession XM\_034624), a gene which may play an important role in the development and/or progression of various types of cancer . Accordingly, utilities of VGAM1671 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GASC1. The function of GASC1 has been established by previous studies. Frequent amplification of DNA copy number at chromosome 9p24-p23 has been demonstrated in cell lines derived from esophageal squamous cell carcinomas

(Yang et al., 2000). Yang et al. (2000) used fluorescence in situ hybridization and Southern blot analysis to map the 9p24–p23 amplicon. They then screened target genes/transcripts present within this amplicon by Northern blot analysis. With this strategy, they cloned a novel gene, which they designated 'gene amplified in squamous cell carcinoma–1' (GASC1), that was amplified and overexpressed in several cell lines. The deduced 1,056–amino acid GASC1 protein contains 2 PHD finger motifs and a PX domain. PHD finger motifs are zinc finger–like sequences found in nuclear proteins that participate in chromatin–mediated transcriptional regulation and are present in a number of protooncogenes. Yang et al. (2000) suggested that overexpression of GASC1 may play an important role in the development and/or progression of various types of cancer, including esophageal squamous cell carcinoma. Nagase et al. (1998) mapped the GASC1 gene, which they designated KIAA0780, to chromosome 9 by radiation hybrid analysis.

[56439] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[56440] Nagase, T.; Ishikawa, K.; Suyama, M.; Kikuno, R.; Miyajima,

N.; Tanaka, A.; Kotani, H.; Nomura, N.; Ohara, O. : Prediction of the coding sequences of unidentified human genes. XI. The complete sequences of 100 new cDNA clones from brain which code for large proteins in vitro. DNA Res. 5: 277–286, 1998. ; and

[56441] Yang, Z.-Q.; Imoto, I.; Fukuda, Y.; Pimkhaokham, A.; Shimada, Y.; Imamura, M.; Sugano, S.; Nakamura, Y.; Inazawa, J. : Identification of a novel gene, GASC1, within an amplicon at 9p23-.

[56442] Further studies establishing the function and utilities of GASC1 are found in John Hopkins OMIM database record ID 605469, and in cited publications numbered 7048 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. LIM Domain Only 2 (rhombotin-like 1) (LMO2, Accession NM\_005574) is another VGAM1671 host target gene. LMO2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LMO2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LMO2 BINDING SITE, designated SEQ ID:12100, to the nucleotide sequence of VGAM1671 RNA, herein designated VGAM RNA,

also designated SEQ ID:4382.

[56443] Another function of VGAM1671 is therefore inhibition of LIM Domain Only 2 (rhombotin-like 1) (LMO2, Accession NM\_005574). Accordingly, utilities of VGAM1671 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LMO2. Leucine-zipper-like Transcriptional Regulator, 1 (LZTR1, Accession NM\_006767) is another VGAM1671 host target gene. LZTR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LZTR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LZTR1 BINDING SITE, designated SEQ ID:13641, to the nucleotide sequence of VGAM1671 RNA, herein designated VGAM RNA, also designated SEQ ID:4382.

[56444] Another function of VGAM1671 is therefore inhibition of Leucine-zipper-like Transcriptional Regulator, 1 (LZTR1, Accession NM\_006767). Accordingly, utilities of VGAM1671 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LZTR1. Mucin 4, Tracheobronchial (MUC4, Accession NM\_138298)

is another VGAM1671 host target gene. MUC4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MUC4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MUC4 BINDING SITE, designated SEQ ID:28709, to the nucleotide sequence of VGAM1671 RNA, herein designated VGAM RNA, also designated SEQ ID:4382.

[56445] Another function of VGAM1671 is therefore inhibition of Mucin 4, Tracheobronchial (MUC4, Accession NM\_138298), a gene which may act as a ligand for ErbB2 mediated cell signalling. Accordingly, utilities of VGAM1671 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MUC4. The function of MUC4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1290.P21/Cdc42/Rac1-activated Kinase 1 (STE20 homolog, yeast) (PAK1, Accession NM\_002576) is another VGAM1671 host target gene. PAK1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PAK1, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAK1 BINDING SITE, designated SEQ ID:8434, to the nucleotide sequence of VGAM1671 RNA, herein designated VGAM RNA, also designated SEQ ID:4382.

[56446] Another function of VGAM1671 is therefore inhibition of P21/Cdc42/Rac1-activated Kinase 1 (STE20 homolog, yeast) (PAK1, Accession NM\_002576), a gene which activates the Jun N-terminal kinase MAP kinase pathway. Accordingly, utilities of VGAM1671 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAK1. The function of PAK1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1621. RalA Binding Protein 1 (RALBP1, Accession NM\_006788) is another VGAM1671 host target gene. RALBP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RALBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RALBP1 BINDING SITE, des-

ignated SEQ ID:13666, to the nucleotide sequence of VGAM1671 RNA, herein designated VGAM RNA, also designated SEQ ID:4382.

[56447] Another function of VGAM1671 is therefore inhibition of RalA Binding Protein 1 (RALBP1, Accession NM\_006788), a gene which plays a role in signal transduction and catalyzes the transport of glutathione conjugates and xenobiotics. Accordingly, utilities of VGAM1671 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RALBP1. The function of RALBP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM345. Sex Comb On Midleg-like 2 (Drosophila) (SCML2, Accession NM\_006089) is another VGAM1671 host target gene. SCML2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCML2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCML2 BINDING SITE, designated SEQ ID:12736, to the nucleotide sequence of VGAM1671 RNA, herein designated VGAM RNA, also designated SEQ

ID:4382.

[56448] Another function of VGAM1671 is therefore inhibition of Sex Comb On Midleg-like 2 (*Drosophila*) (SCML2, Accession NM\_006089). Accordingly, utilities of VGAM1671 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCML2. SH2 Domain Containing Phosphatase Anchor Protein 1 (SPAP1, Accession NM\_030764) is another VGAM1671 host target gene. SPAP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SPAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPAP1 BINDING SITE, designated SEQ ID:25049, to the nucleotide sequence of VGAM1671 RNA, herein designated VGAM RNA, also designated SEQ ID:4382.

[56449] Another function of VGAM1671 is therefore inhibition of SH2 Domain Containing Phosphatase Anchor Protein 1 (SPAP1, Accession NM\_030764), a gene which regulation of immunologic function. Accordingly, utilities of VGAM1671 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPAP1.

The function of SPAP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM672. Chromosome 11 Open Reading Frame 15 (C11orf15, Accession NM\_020644) is another VGAM1671 host target gene. C11orf15 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C11orf15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C11orf15 BINDING SITE, designated SEQ ID:21807, to the nucleotide sequence of VGAM1671 RNA, herein designated VGAM RNA, also designated SEQ ID:4382.

[56450] Another function of VGAM1671 is therefore inhibition of Chromosome 11 Open Reading Frame 15 (C11orf15, Accession NM\_020644). Accordingly, utilities of VGAM1671 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C11orf15. Chromosome 21 Open Reading Frame 42 (C21orf42, Accession NM\_058184) is another VGAM1671 host target gene. C21orf42 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

C21orf42, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C21orf42 BINDING SITE, designated SEQ ID:27748, to the nucleotide sequence of VGAM1671 RNA, herein designated VGAM RNA, also designated SEQ ID:4382.

[56451] Another function of VGAM1671 is therefore inhibition of Chromosome 21 Open Reading Frame 42 (C21orf42, Accession NM\_058184). Accordingly, utilities of VGAM1671 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C21orf42. CGG Triplet Repeat Binding Protein 1 (CGGBP1, Accession NM\_003663) is another VGAM1671 host target gene. CGGBP1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CGGBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CGGBP1 BINDING SITE, designated SEQ ID:9742, to the nucleotide sequence of VGAM1671 RNA, herein designated VGAM RNA, also designated SEQ ID:4382.

[56452] Another function of VGAM1671 is therefore inhibition of CGG Triplet Repeat Binding Protein 1 (CGGBP1, Accession NM\_003663). Accordingly, utilities of VGAM1671 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CGGBP1. DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 12 (CHL1-like helicase homolog, *S. cerevisiae*) (DDX12, Accession XM\_006936) is another VGAM1671 host target gene. DDX12 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DDX12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDX12 BINDING SITE, designated SEQ ID:30025, to the nucleotide sequence of VGAM1671 RNA, herein designated VGAM RNA, also designated SEQ ID:4382.

[56453] Another function of VGAM1671 is therefore inhibition of DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 12 (CHL1-like helicase homolog, *S. cerevisiae*) (DDX12, Accession XM\_006936). Accordingly, utilities of VGAM1671 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX12. Deiodi-

nase, Iodothyronine, Type II (DIO2, Accession NM\_000793) is another VGAM1671 host target gene. DIO2 BINDING SITE1 and DIO2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DIO2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DIO2 BINDING SITE1 and DIO2 BINDING SITE2, designated SEQ ID:6457 and SEQ ID:15168 respectively, to the nucleotide sequence of VGAM1671 RNA, herein designated VGAM RNA, also designated SEQ ID:4382.

[56454] Another function of VGAM1671 is therefore inhibition of Deiodinase, Iodothyronine, Type II (DIO2, Accession NM\_000793). Accordingly, utilities of VGAM1671 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DIO2. FLJ10761 (Accession NM\_018208) is another VGAM1671 host target gene. FLJ10761 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10761, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of FLJ10761 BINDING SITE, designated SEQ ID:20106, to the nucleotide sequence of VGAM1671 RNA, herein designated VGAM RNA, also designated SEQ ID:4382.

[56455] Another function of VGAM1671 is therefore inhibition of FLJ10761 (Accession NM\_018208). Accordingly, utilities of VGAM1671 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10761. FLJ20509 (Accession NM\_017851) is another VGAM1671 host target gene. FLJ20509 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20509, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20509 BINDING SITE, designated SEQ ID:19525, to the nucleotide sequence of VGAM1671 RNA, herein designated VGAM RNA, also designated SEQ ID:4382.

[56456] Another function of VGAM1671 is therefore inhibition of FLJ20509 (Accession NM\_017851). Accordingly, utilities of VGAM1671 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20509. FYVE and Coiled-coil Domain Containing 1

(FYCO1, Accession NM\_024513) is another VGAM1671 host target gene. FYCO1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FYCO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FYCO1 BINDING SITE, designated SEQ ID:23710, to the nucleotide sequence of VGAM1671 RNA, herein designated VGAM RNA, also designated SEQ ID:4382.

[56457] Another function of VGAM1671 is therefore inhibition of FYVE and Coiled-coil Domain Containing 1 (FYCO1, Accession NM\_024513). Accordingly, utilities of VGAM1671 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FYCO1. Glycoprotein A33 (transmembrane) (GPA33, Accession NM\_005814) is another VGAM1671 host target gene. GPA33 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPA33, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPA33 BINDING SITE, designated SEQ

ID:12402, to the nucleotide sequence of VGAM1671 RNA, herein designated VGAM RNA, also designated SEQ ID:4382.

[56458] Another function of VGAM1671 is therefore inhibition of Glycoprotein A33 (transmembrane) (GPA33, Accession NM\_005814). Accordingly, utilities of VGAM1671 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPA33. KIAA0258 (Accession NM\_014785) is another VGAM1671 host target gene. KIAA0258 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0258, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0258 BINDING SITE, designated SEQ ID:16649, to the nucleotide sequence of VGAM1671 RNA, herein designated VGAM RNA, also designated SEQ ID:4382.

[56459] Another function of VGAM1671 is therefore inhibition of KIAA0258 (Accession NM\_014785). Accordingly, utilities of VGAM1671 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0258. KIAA0326 (Accession XM\_034819) is another

VGAM1671 host target gene. KIAA0326 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0326, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0326 BINDING SITE, designated SEQ ID:32159, to the nucleotide sequence of VGAM1671 RNA, herein designated VGAM RNA, also designated SEQ ID:4382.

[56460] Another function of VGAM1671 is therefore inhibition of KIAA0326 (Accession XM\_034819). Accordingly, utilities of VGAM1671 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0326. KIAA0939 (Accession XM\_030524) is another VGAM1671 host target gene. KIAA0939 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0939, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0939 BINDING SITE, designated SEQ ID:31068, to the nucleotide sequence of VGAM1671 RNA, herein designated VGAM RNA, also designated SEQ ID:4382.

[56461] Another function of VGAM1671 is therefore inhibition of KIAA0939 (Accession XM\_030524). Accordingly, utilities of VGAM1671 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0939. KIAA1853 (Accession XM\_045184) is another VGAM1671 host target gene. KIAA1853 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1853, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1853 BINDING SITE, designated SEQ ID:34389, to the nucleotide sequence of VGAM1671 RNA, herein designated VGAM RNA, also designated SEQ ID:4382.

[56462] Another function of VGAM1671 is therefore inhibition of KIAA1853 (Accession XM\_045184). Accordingly, utilities of VGAM1671 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1853. MDS028 (Accession NM\_018463) is another VGAM1671 host target gene. MDS028 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MDS028, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MDS028 BINDING SITE, designated SEQ ID:20536, to the nucleotide sequence of VGAM1671 RNA, herein designated VGAM RNA, also designated SEQ ID:4382.

[56463] Another function of VGAM1671 is therefore inhibition of MDS028 (Accession NM\_018463). Accordingly, utilities of VGAM1671 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MDS028. Mesoderm Development Candidate 2 (MESDC2, Accession XM\_051854) is another VGAM1671 host target gene. MESDC2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MESDC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MESDC2 BINDING SITE, designated SEQ ID:35894, to the nucleotide sequence of VGAM1671 RNA, herein designated VGAM RNA, also designated SEQ ID:4382.

[56464] Another function of VGAM1671 is therefore inhibition of Mesoderm Development Candidate 2 (MESDC2, Accession XM\_051854). Accordingly, utilities of VGAM1671 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with MESDC2. NDRG Family Member 4 (NDRG4, Accession NM\_022910) is another VGAM1671 host target gene. NDRG4 BINDING SITE1 and NDRG4 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by NDRG4, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NDRG4 BINDING SITE1 and NDRG4 BINDING SITE2, designated SEQ ID:23216 and SEQ ID:21701 respectively, to the nucleotide sequence of VGAM1671 RNA, herein designated VGAM RNA, also designated SEQ ID:4382.

[56465] Another function of VGAM1671 is therefore inhibition of NDRG Family Member 4 (NDRG4, Accession NM\_022910). Accordingly, utilities of VGAM1671 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NDRG4. Rho-related BTB Domain Containing 2 (RHOBTB2, Accession XM\_027679) is another VGAM1671 host target gene. RHOBTB2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RHOBTB2, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RHOBTB2 BINDING SITE, designated SEQ ID:30558, to the nucleotide sequence of VGAM1671 RNA, herein designated VGAM RNA, also designated SEQ ID:4382.

[56466] Another function of VGAM1671 is therefore inhibition of Rho-related BTB Domain Containing 2 (RHOBTB2, Accession XM\_027679). Accordingly, utilities of VGAM1671 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RHOBTB2. Synaptotagmin-like 4 (granuphilin-a) (SYTL4, Accession NM\_080737) is another VGAM1671 host target gene. SYTL4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SYTL4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYTL4 BINDING SITE, designated SEQ ID:28024, to the nucleotide sequence of VGAM1671 RNA, herein designated VGAM RNA, also designated SEQ ID:4382.

[56467] Another function of VGAM1671 is therefore inhibition of Synaptotagmin-like 4 (granuphilin-a) (SYTL4, Accession

NM\_080737). Accordingly, utilities of VGAM1671 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYTL4. Tripartite Motif-containing 38 (TRIM38, Accession NM\_006355) is another VGAM1671 host target gene. TRIM38 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRIM38, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM38 BINDING SITE, designated SEQ ID:13050, to the nucleotide sequence of VGAM1671 RNA, herein designated VGAM RNA, also designated SEQ ID:4382.

[56468] Another function of VGAM1671 is therefore inhibition of Tripartite Motif-containing 38 (TRIM38, Accession NM\_006355). Accordingly, utilities of VGAM1671 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM38. LOC122970 (Accession XM\_058672) is another VGAM1671 host target gene. LOC122970 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC122970, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC122970 BINDING SITE, designated SEQ ID:36715, to the nucleotide sequence of VGAM1671 RNA, herein designated VGAM RNA, also designated SEQ ID:4382.

[56469] Another function of VGAM1671 is therefore inhibition of LOC122970 (Accession XM\_058672). Accordingly, utilities of VGAM1671 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC122970. LOC126755 (Accession XM\_059074) is another VGAM1671 host target gene. LOC126755 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC126755, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126755 BINDING SITE, designated SEQ ID:36857, to the nucleotide sequence of VGAM1671 RNA, herein designated VGAM RNA, also designated SEQ ID:4382.

[56470] Another function of VGAM1671 is therefore inhibition of LOC126755 (Accession XM\_059074). Accordingly, utilities of VGAM1671 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC126755. LOC126782 (Accession XM\_059080) is another VGAM1671 host target gene. LOC126782 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC126782, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126782 BINDING SITE, designated SEQ ID:36860, to the nucleotide sequence of VGAM1671 RNA, herein designated VGAM RNA, also designated SEQ ID:4382.

[56471] Another function of VGAM1671 is therefore inhibition of LOC126782 (Accession XM\_059080). Accordingly, utilities of VGAM1671 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126782. LOC144742 (Accession XM\_084949) is another VGAM1671 host target gene. LOC144742 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC144742, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144742 BINDING SITE, designated SEQ ID:37779, to the nucleotide sequence of VGAM1671 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4382.

[56472] Another function of VGAM1671 is therefore inhibition of LOC144742 (Accession XM\_084949). Accordingly, utilities of VGAM1671 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144742. LOC145468 (Accession XM\_057874) is another VGAM1671 host target gene. LOC145468 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145468, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145468 BINDING SITE, designated SEQ ID:36548, to the nucleotide sequence of VGAM1671 RNA, herein designated VGAM RNA, also designated SEQ ID:4382.

[56473] Another function of VGAM1671 is therefore inhibition of LOC145468 (Accession XM\_057874). Accordingly, utilities of VGAM1671 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145468. LOC150155 (Accession XM\_047977) is another VGAM1671 host target gene. LOC150155 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150155, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150155 BINDING SITE, designated SEQ ID:35089, to the nucleotide sequence of VGAM1671 RNA, herein designated VGAM RNA, also designated SEQ ID:4382.

[56474] Another function of VGAM1671 is therefore inhibition of LOC150155 (Accession XM\_047977). Accordingly, utilities of VGAM1671 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150155. LOC152503 (Accession XM\_098238) is another VGAM1671 host target gene. LOC152503 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152503, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152503 BINDING SITE, designated SEQ ID:41518, to the nucleotide sequence of VGAM1671 RNA, herein designated VGAM RNA, also designated SEQ ID:4382.

[56475] Another function of VGAM1671 is therefore inhibition of LOC152503 (Accession XM\_098238). Accordingly, utilities of VGAM1671 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC152503. LOC153577 (Accession XM\_098394) is another VGAM1671 host target gene. LOC153577 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153577, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153577 BINDING SITE, designated SEQ ID:41647, to the nucleotide sequence of VGAM1671 RNA, herein designated VGAM RNA, also designated SEQ ID:4382.

[56476] Another function of VGAM1671 is therefore inhibition of LOC153577 (Accession XM\_098394). Accordingly, utilities of VGAM1671 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153577. LOC154428 (Accession XM\_098528) is another VGAM1671 host target gene. LOC154428 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC154428, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154428 BINDING SITE, designated SEQ ID:41702, to

the nucleotide sequence of VGAM1671 RNA, herein designated VGAM RNA, also designated SEQ ID:4382.

[56477] Another function of VGAM1671 is therefore inhibition of LOC154428 (Accession XM\_098528). Accordingly, utilities of VGAM1671 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154428. LOC163081 (Accession XM\_091987) is another VGAM1671 host target gene. LOC163081 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC163081, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163081 BINDING SITE, designated SEQ ID:40086, to the nucleotide sequence of VGAM1671 RNA, herein designated VGAM RNA, also designated SEQ ID:4382.

[56478] Another function of VGAM1671 is therefore inhibition of LOC163081 (Accession XM\_091987). Accordingly, utilities of VGAM1671 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163081. LOC196872 (Accession XM\_113760) is another VGAM1671 host target gene. LOC196872 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC196872, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196872 BINDING SITE, designated SEQ ID:42418, to the nucleotide sequence of VGAM1671 RNA, herein designated VGAM RNA, also designated SEQ ID:4382.

[56479] Another function of VGAM1671 is therefore inhibition of LOC196872 (Accession XM\_113760). Accordingly, utilities of VGAM1671 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196872. LOC199232 (Accession XM\_114336) is another VGAM1671 host target gene. LOC199232 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC199232, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199232 BINDING SITE, designated SEQ ID:42881, to the nucleotide sequence of VGAM1671 RNA, herein designated VGAM RNA, also designated SEQ ID:4382.

[56480] Another function of VGAM1671 is therefore inhibition of LOC199232 (Accession XM\_114336). Accordingly, utilities

of VGAM1671 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199232. LOC219401 (Accession XM\_166706) is another VGAM1671 host target gene. LOC219401 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219401, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219401 BINDING SITE, designated SEQ ID:44586, to the nucleotide sequence of VGAM1671 RNA, herein designated VGAM RNA, also designated SEQ ID:4382.

[56481] Another function of VGAM1671 is therefore inhibition of LOC219401 (Accession XM\_166706). Accordingly, utilities of VGAM1671 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219401. LOC221495 (Accession XM\_168136) is another VGAM1671 host target gene. LOC221495 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221495, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC221495 BINDING SITE, designated SEQ ID:45058, to the nucleotide sequence of VGAM1671 RNA, herein designated VGAM RNA, also designated SEQ ID:4382.

[56482] Another function of VGAM1671 is therefore inhibition of LOC221495 (Accession XM\_168136). Accordingly, utilities of VGAM1671 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221495. LOC255565 (Accession XM\_170811) is another VGAM1671 host target gene. LOC255565 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255565, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255565 BINDING SITE, designated SEQ ID:45588, to the nucleotide sequence of VGAM1671 RNA, herein designated VGAM RNA, also designated SEQ ID:4382.

[56483] Another function of VGAM1671 is therefore inhibition of LOC255565 (Accession XM\_170811). Accordingly, utilities of VGAM1671 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255565. LOC51580 (Accession NM\_015874) is another VGAM1671 host target gene. LOC51580 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51580, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51580 BINDING SITE, designated SEQ ID:18011, to the nucleotide sequence of VGAM1671 RNA, herein designated VGAM RNA, also designated SEQ ID:4382.

[56484] Another function of VGAM1671 is therefore inhibition of LOC51580 (Accession NM\_015874). Accordingly, utilities of VGAM1671 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51580. LOC90010 (Accession XM\_028150) is another VGAM1671 host target gene. LOC90010 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90010, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90010 BINDING SITE, designated SEQ ID:30621, to the nucleotide sequence of VGAM1671 RNA, herein designated VGAM RNA, also designated SEQ ID:4382.

[56485] Another function of VGAM1671 is therefore inhibition of

LOC90010 (Accession XM\_028150). Accordingly, utilities of VGAM1671 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90010. LOC90249 (Accession XM\_030300) is another VGAM1671 host target gene. LOC90249 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90249, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90249 BINDING SITE, designated SEQ ID:31013, to the nucleotide sequence of VGAM1671 RNA, herein designated VGAM RNA, also designated SEQ ID:4382.

[56486] Another function of VGAM1671 is therefore inhibition of LOC90249 (Accession XM\_030300). Accordingly, utilities of VGAM1671 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90249. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1672 (VGAM1672) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[56487] VGAM1672 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1672 was detected is described hereinabove with reference to Figs. 1–8.

[56488] VGAM1672 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tick-borne Encephalitis Virus. VGAM1672 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[56489] VGAM1672 gene encodes a VGAM1672 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1672 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1672 precursor RNA is designated SEQ ID:1658, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1658 is located at position 9955 relative to the genome of Tick-borne Encephalitis Virus.

[56490] VGAM1672 precursor RNA folds onto itself, forming VGAM1672 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two–

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[56491] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1672 folded precursor RNA into VGAM1672 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of VGAM1672 RNA is designated SEQ ID:4383, and is provided hereinbelow with reference to the sequence listing part.

[56492] VGAM1672 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1672 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1672 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[56493] VGAM1672 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1672 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1672 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1672 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1672 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[56494] The complementary binding of VGAM1672 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1672 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1672 host target RNA into VGAM1672 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[56495] It is appreciated that VGAM1672 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1672 host target genes. The mRNA of each one of this plurality of VGAM1672 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1672 RNA, herein designated VGAM RNA, and which when bound by VGAM1672 RNA causes inhibition of translation of respective one or more VGAM1672 host target proteins.

[56496] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1672 gene, herein designated VGAM GENE, on one

or more VGAM1672 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[56497] It is yet further appreciated that a function of VGAM1672 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1672 include diagnosis, prevention and treatment of viral infection by Tick-borne Encephalitis Virus. Specific functions, and accordingly utilities, of VGAM1672 correlate with, and may be deduced from, the identity of the host target genes which VGAM1672 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[56498] Nucleotide sequences of the VGAM1672 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1672 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1672 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1672 are further described hereinbelow with reference to Table 1.

[56499] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1672 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1672 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[56500] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1672 gene, herein designated VGAM is inhibition of expression of VGAM1672 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1672 correlate with, and may be deduced from, the identity of the target genes which VGAM1672 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[56501] KIAA0089 (Accession XM\_046056) is a VGAM1672 host

target gene. KIAA0089 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0089, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0089 BINDING SITE, designated SEQ ID:34668, to the nucleotide sequence of VGAM1672 RNA, herein designated VGAM RNA, also designated SEQ ID:4383.

[56502] A function of VGAM1672 is therefore inhibition of KIAA0089 (Accession XM\_046056). Accordingly, utilities of VGAM1672 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0089. KIAA0227 (Accession XM\_027236) is another VGAM1672 host target gene. KIAA0227 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0227, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0227 BINDING SITE, designated SEQ ID:30455, to the nucleotide sequence of VGAM1672 RNA, herein designated VGAM RNA, also designated SEQ ID:4383.

[56503] Another function of VGAM1672 is therefore inhibition of KIAA0227 (Accession XM\_027236). Accordingly, utilities of VGAM1672 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0227. KIAA1708 (Accession XM\_040211) is another VGAM1672 host target gene. KIAA1708 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1708, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1708 BINDING SITE, designated SEQ ID:33272, to the nucleotide sequence of VGAM1672 RNA, herein designated VGAM RNA, also designated SEQ ID:4383.

[56504] Another function of VGAM1672 is therefore inhibition of KIAA1708 (Accession XM\_040211). Accordingly, utilities of VGAM1672 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1708. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1673 (VGAM1673) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[56505] VGAM1673 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1673 was detected is described hereinabove with reference to Figs. 1–8.

[56506] VGAM1673 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tick-borne Encephalitis Virus. VGAM1673 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[56507] VGAM1673 gene encodes a VGAM1673 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1673 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1673 precursor RNA is designated SEQ ID:1659, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1659 is located at position 6145 relative to the genome of Tick-borne Encephalitis Virus.

[56508] VGAM1673 precursor RNA folds onto itself, forming VGAM1673 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[56509] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1673 folded precursor RNA into VGAM1673 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1673 RNA is designated SEQ ID:4384, and is provided hereinbelow with reference to the sequence listing part.

[56510] VGAM1673 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1673 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1673 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[56511] VGAM1673 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1673 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1673 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1673 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1673 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[56512] The complementary binding of VGAM1673 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1673 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1673 host target RNA into VGAM1673 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[56513] It is appreciated that VGAM1673 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1673 host target genes. The mRNA of each one of this plurality of VGAM1673 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1673 RNA, herein designated VGAM RNA, and which when bound by VGAM1673 RNA causes inhibition of translation of respective one or more VGAM1673 host target proteins.

[56514] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1673 gene, herein designated VGAM GENE, on one or more VGAM1673 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[56515] It is yet further appreciated that a function of VGAM1673 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1673 include diagnosis, prevention and treatment of viral infection by Tick-borne Encephalitis Virus. Specific functions, and accordingly utilities, of VGAM1673 correlate with, and may be deduced from, the identity of the host target genes which VGAM1673 binds and inhibits, and the function of these host target genes,

as elaborated hereinbelow.

[56516] Nucleotide sequences of the VGAM1673 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1673 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1673 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1673 are further described hereinbelow with reference to Table 1.

[56517] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1673 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1673 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[56518] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1673 gene, herein designated VGAM is inhibition of expression of VGAM1673 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1673 correlate with, and may be deduced from, the identity of the target genes which VGAM1673 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[56519] Alcohol Dehydrogenase 4 (class II), Pi Polypeptide (ADH4, Accession NM\_000670) is a VGAM1673 host target gene. ADH4 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ADH4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADH4 BINDING SITE, designated SEQ ID:6321, to the nucleotide sequence of VGAM1673 RNA, herein designated VGAM RNA, also designated SEQ ID:4384.

[56520] A function of VGAM1673 is therefore inhibition of Alcohol Dehydrogenase 4 (class II), Pi Polypeptide (ADH4, Accession NM\_000670). Accordingly, utilities of VGAM1673 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADH4. Ankyrin 3, Node of Ranvier (ankyrin G) (ANK3, Accession NM\_020987) is another VGAM1673 host target gene. ANK3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ANK3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ANK3 BINDING SITE, designated SEQ ID:21981, to the nucleotide se-

quence of VGAM1673 RNA, herein designated VGAM RNA, also designated SEQ ID:4384.

[56521] Another function of VGAM1673 is therefore inhibition of Ankyrin 3, Node of Ranvier (ankyrin G) (ANK3, Accession NM\_020987), a gene which plays key roles in activities such as cell motility, activation, proliferation. Accordingly, utilities of VGAM1673 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANK3. The function of ANK3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1527. Copine III (CPNE3, Accession NM\_003909) is another VGAM1673 host target gene. CPNE3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CPNE3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CPNE3 BINDING SITE, designated SEQ ID:9991, to the nucleotide sequence of VGAM1673 RNA, herein designated VGAM RNA, also designated SEQ ID:4384.

[56522] Another function of VGAM1673 is therefore inhibition of Copine III (CPNE3, Accession NM\_003909), a gene which

may function in membrane trafficking. Accordingly, utilities of VGAM1673 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPNE3. The function of CPNE3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM28. V-jun Sarcoma Virus 17 Oncogene Homolog (avian) (JUN, Accession NM\_002228) is another VGAM1673 host target gene. JUN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by JUN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JUN BINDING SITE, designated SEQ ID:8009, to the nucleotide sequence of VGAM1673 RNA, herein designated VGAM RNA, also designated SEQ ID:4384.

[56523] Another function of VGAM1673 is therefore inhibition of V-jun Sarcoma Virus 17 Oncogene Homolog (avian) (JUN, Accession NM\_002228), a gene which binds and recognizes the enhancer dna sequencetga(c/g)tca. Accordingly, utilities of VGAM1673 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with JUN. The function of JUN has been established by previous studies. The oncogene JUN is the putative transforming gene of avian sarcoma virus 17; it appears to be derived from a gene of the chicken genome and has homologs in several other vertebrate species. (The name JUN comes from the Japanese 'ju-nana,' meaning the number 17.) JUN was originally thought to be identical to the transcription factor AP1. However, it is now known that AP1 is not a single protein, but constitutes a group of related dimeric basic region-leucine zipper proteins that belong to the JUN, FOS (OMIM Ref. No. 164810), MAF (OMIM Ref. No. 177075), and ATF (see OMIM Ref. No. 603148) subfamilies. The various dimers recognize either 12-O-tetradecanoylphorbol-13-acetate (TPA) response elements or cAMP response elements. JUN is the most potent transcriptional activator in its group, and its transcriptional activity is attenuated and sometimes antagonized by JUNB (OMIM Ref. No. 165161). For a review of the structure and function of the AP1 transcription complexes Using a Drosophila model synapse, Sanyal et al. (2002) analyzed cellular functions and regulation of the immediate-early transcription factor AP1, a heterodimer of the basic leucine zipper proteins FOS and JUN. They observed

that AP1 positively regulates synaptic strength and synapse number, thus showing a greater range of influence than CREB (OMIM Ref. No. 123810). Observations from genetic epistasis and RNA quantification experiments indicate that AP1 acts upstream of CREB, regulates levels of CREB mRNA, and functions at the top of the hierarchy of transcription factors known to regulate long-term plasticity. A JUN-kinase signaling module provided a CREB-independent route for neuronal AP1 activation; thus, CREB regulation of AP1 expression may, in some neurons, constitute a positive feedback loop rather than the primary step in AP1 activation. Mathas et al. (2002) found AP1 constitutively activated, with robust JUN and JUNB overexpression, in all cell lines derived from patients with classical Hodgkin lymphoma (OMIM Ref. No. 236000) and anaplastic large cell lymphoma (ALCL), but not in other lymphoma types. AP1 supported proliferation of Hodgkin cells, but suppressed apoptosis of ALCL cells. Mathas et al. (2002) noted that, whereas JUN is upregulated by an autoregulatory process, JUNB is under the control of nuclear factor kappa-B (NFKB; 164011). They found that AP1 and NFKB cooperate and stimulate expression of the cell cycle regulator cyclin D2 (OMIM Ref. No.

123833), the protooncogene MET (OMIM Ref. No. 164860), and the lymphocyte homing receptor CCR7 (OMIM Ref. No. 600242), which are all strongly expressed in primary Hodgkin/Reed–Sternberg (HRS) cells.

[56524] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[56525] Sanyal, S.; Sandstrom, D. J.; Hoeffler, C. A.; Ramaswami, M. : AP–1 function upstream of CREB to control synaptic plasticity in *Drosophila*. *Nature* 416: 870–874, 2002. ; and

[56526] Mathas, S.; Hinz, M.; Anagnostopoulos, I.; Krappmann, D.; Lietz, A.; Jundt, F.; Bommert, K.; Mehta–Grigoriou, F.; Stein, H.; Dorken, B.; Scheidereit, C. : Aberrantly expressed c–Jun an.

[56527] Further studies establishing the function and utilities of JUN are found in John Hopkins OMIM database record ID 165160, and in cited publications numbered 4959, 5112–511 and 12745–5121 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Protein Phosphatase 2 (formerly 2A), Regulatory Subunit B (PR 52), Beta Isoform (PPP2R2B, Accession NM\_004576) is another VGAM1673 host target gene. PPP2R2B BINDING SITE is HOST TARGET binding site found

in the 3' untranslated region of mRNA encoded by PPP2R2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP2R2B BINDING SITE, designated SEQ ID:10921, to the nucleotide sequence of VGAM1673 RNA, herein designated VGAM RNA, also designated SEQ ID:4384.

[56528] Another function of VGAM1673 is therefore inhibition of Protein Phosphatase 2 (formerly 2A), Regulatory Subunit B (PR 52), Beta Isoform (PPP2R2B, Accession NM\_004576). Accordingly, utilities of VGAM1673 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP2R2B. Chromosome 6 Open Reading Frame 37 (C6orf37, Accession XM\_041375) is another VGAM1673 host target gene. C6orf37 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C6orf37, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C6orf37 BINDING SITE, designated SEQ ID:33508, to the nucleotide sequence of VGAM1673 RNA, herein designated VGAM

RNA, also designated SEQ ID:4384.

[56529] Another function of VGAM1673 is therefore inhibition of Chromosome 6 Open Reading Frame 37 (C6orf37, Accession XM\_041375). Accordingly, utilities of VGAM1673 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C6orf37. Cyclin M1 (CNNM1, Accession NM\_020348) is another VGAM1673 host target gene. CNNM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CNNM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNNM1 BINDING SITE, designated SEQ ID:21603, to the nucleotide sequence of VGAM1673 RNA, herein designated VGAM RNA, also designated SEQ ID:4384.

[56530] Another function of VGAM1673 is therefore inhibition of Cyclin M1 (CNNM1, Accession NM\_020348). Accordingly, utilities of VGAM1673 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNNM1. Erythrocyte Membrane Protein Band 4.1-like 1 (EPB41L1, Accession XM\_047295) is another VGAM1673 host target gene. EPB41L1 BINDING SITE is HOST TARGET

binding site found in the 3` untranslated region of mRNA encoded by EPB41L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPB41L1 BINDING SITE, designated SEQ ID:34935, to the nucleotide sequence of VGAM1673 RNA, herein designated VGAM RNA, also designated SEQ ID:4384.

[56531] Another function of VGAM1673 is therefore inhibition of Erythrocyte Membrane Protein Band 4.1-like 1 (EPB41L1, Accession XM\_047295). Accordingly, utilities of VGAM1673 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPB41L1. FLJ10350 (Accession XM\_170946) is another VGAM1673 host target gene. FLJ10350 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10350, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10350 BINDING SITE, designated SEQ ID:45731, to the nucleotide sequence of VGAM1673 RNA, herein designated VGAM RNA, also designated SEQ ID:4384.

[56532] Another function of VGAM1673 is therefore inhibition of FLJ10350 (Accession XM\_170946). Accordingly, utilities of VGAM1673 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10350. FLJ10420 (Accession NM\_018090) is another VGAM1673 host target gene. FLJ10420 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10420, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10420 BINDING SITE, designated SEQ ID:19854, to the nucleotide sequence of VGAM1673 RNA, herein designated VGAM RNA, also designated SEQ ID:4384.

[56533] Another function of VGAM1673 is therefore inhibition of FLJ10420 (Accession NM\_018090). Accordingly, utilities of VGAM1673 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10420. FLJ13213 (Accession NM\_024755) is another VGAM1673 host target gene. FLJ13213 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ13213, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13213 BINDING SITE, designated SEQ ID:24098, to the nucleotide sequence of VGAM1673 RNA, herein designated VGAM RNA, also designated SEQ ID:4384.

[56534] Another function of VGAM1673 is therefore inhibition of FLJ13213 (Accession NM\_024755). Accordingly, utilities of VGAM1673 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13213. FLJ13964 (Accession NM\_032186) is another VGAM1673 host target gene. FLJ13964 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13964, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13964 BINDING SITE, designated SEQ ID:25900, to the nucleotide sequence of VGAM1673 RNA, herein designated VGAM RNA, also designated SEQ ID:4384.

[56535] Another function of VGAM1673 is therefore inhibition of FLJ13964 (Accession NM\_032186). Accordingly, utilities of VGAM1673 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ13964. 5'-nucleotidase, Cytosolic IB (NT5C1B, Accession XM\_048837) is another VGAM1673 host target gene. NT5C1B BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NT5C1B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NT5C1B BINDING SITE, designated SEQ ID:35283, to the nucleotide sequence of VGAM1673 RNA, herein designated VGAM RNA, also designated SEQ ID:4384.

[56536] Another function of VGAM1673 is therefore inhibition of 5'-nucleotidase, Cytosolic IB (NT5C1B, Accession XM\_048837). Accordingly, utilities of VGAM1673 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NT5C1B. PRO2133 (Accession NM\_018619) is another VGAM1673 host target gene. PRO2133 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO2133, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2133 BINDING SITE, designated

SEQ ID:20689, to the nucleotide sequence of VGAM1673 RNA, herein designated VGAM RNA, also designated SEQ ID:4384.

[56537] Another function of VGAM1673 is therefore inhibition of PRO2133 (Accession NM\_018619). Accordingly, utilities of VGAM1673 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2133. LOC132332 (Accession XM\_072306) is another VGAM1673 host target gene. LOC132332 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC132332, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC132332 BINDING SITE, designated SEQ ID:37485, to the nucleotide sequence of VGAM1673 RNA, herein designated VGAM RNA, also designated SEQ ID:4384.

[56538] Another function of VGAM1673 is therefore inhibition of LOC132332 (Accession XM\_072306). Accordingly, utilities of VGAM1673 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC132332. LOC146713 (Accession XM\_097071) is another VGAM1673 host target gene. LOC146713 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146713, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146713 BINDING SITE, designated SEQ ID:40713, to the nucleotide sequence of VGAM1673 RNA, herein designated VGAM RNA, also designated SEQ ID:4384.

[56539] Another function of VGAM1673 is therefore inhibition of LOC146713 (Accession XM\_097071). Accordingly, utilities of VGAM1673 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146713. LOC146952 (Accession XM\_097138) is another VGAM1673 host target gene. LOC146952 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146952, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146952 BINDING SITE, designated SEQ ID:40766, to the nucleotide sequence of VGAM1673 RNA, herein designated VGAM RNA, also designated SEQ ID:4384.

[56540] Another function of VGAM1673 is therefore inhibition of

LOC146952 (Accession XM\_097138). Accordingly, utilities of VGAM1673 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146952. LOC148166 (Accession XM\_086077) is another VGAM1673 host target gene. LOC148166 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148166, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148166 BINDING SITE, designated SEQ ID:38479, to the nucleotide sequence of VGAM1673 RNA, herein designated VGAM RNA, also designated SEQ ID:4384.

[56541] Another function of VGAM1673 is therefore inhibition of LOC148166 (Accession XM\_086077). Accordingly, utilities of VGAM1673 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148166. LOC150174 (Accession XM\_086802) is another VGAM1673 host target gene. LOC150174 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150174, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC150174 BINDING SITE, designated SEQ ID:38868, to the nucleotide sequence of VGAM1673 RNA, herein designated VGAM RNA, also designated SEQ ID:4384.

[56542] Another function of VGAM1673 is therefore inhibition of LOC150174 (Accession XM\_086802). Accordingly, utilities of VGAM1673 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150174. LOC152620 (Accession XM\_011108) is another VGAM1673 host target gene. LOC152620 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152620, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152620 BINDING SITE, designated SEQ ID:30172, to the nucleotide sequence of VGAM1673 RNA, herein designated VGAM RNA, also designated SEQ ID:4384.

[56543] Another function of VGAM1673 is therefore inhibition of LOC152620 (Accession XM\_011108). Accordingly, utilities of VGAM1673 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152620. LOC166042 (Accession XM\_093623) is an-

other VGAM1673 host target gene. LOC166042 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC166042, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC166042 BINDING SITE, designated SEQ ID:40201, to the nucleotide sequence of VGAM1673 RNA, herein designated VGAM RNA, also designated SEQ ID:4384.

[56544] Another function of VGAM1673 is therefore inhibition of LOC166042 (Accession XM\_093623). Accordingly, utilities of VGAM1673 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC166042. LOC206836 (Accession XM\_116750) is another VGAM1673 host target gene. LOC206836 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC206836, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC206836 BINDING SITE, designated SEQ ID:43124, to the nucleotide sequence of VGAM1673 RNA, herein designated VGAM RNA, also designated SEQ ID:4384.

[56545] Another function of VGAM1673 is therefore inhibition of LOC206836 (Accession XM\_116750). Accordingly, utilities of VGAM1673 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC206836. LOC90520 (Accession XM\_032277) is another VGAM1673 host target gene. LOC90520 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90520, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90520 BINDING SITE, designated SEQ ID:31630, to the nucleotide sequence of VGAM1673 RNA, herein designated VGAM RNA, also designated SEQ ID:4384.

[56546] Another function of VGAM1673 is therefore inhibition of LOC90520 (Accession XM\_032277). Accordingly, utilities of VGAM1673 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90520. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1674 (VGAM1674) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[56547] VGAM1674 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1674 was detected is described hereinabove with reference to Figs. 1–8.

[56548] VGAM1674 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tick-borne Encephalitis Virus. VGAM1674 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[56549] VGAM1674 gene encodes a VGAM1674 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1674 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1674 precursor RNA is designated SEQ ID:1660, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1660 is located at position 4389 relative to the genome of Tick-borne Encephalitis Virus.

[56550] VGAM1674 precursor RNA folds onto itself, forming VGAM1674 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[56551] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1674 folded precursor RNA into VGAM1674 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 56%) nucleotide sequence of VGAM1674 RNA is designated SEQ ID:4385, and is provided hereinbelow with reference to the sequence listing part.

[56552] VGAM1674 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1674 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1674 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[56553] VGAM1674 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1674 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1674 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1674 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1674 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[56554] The complementary binding of VGAM1674 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1674 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1674 host target RNA into VGAM1674 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[56555] It is appreciated that VGAM1674 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1674 host target genes. The mRNA of each one of this plurality of VGAM1674 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1674 RNA, herein designated VGAM RNA, and which when bound by VGAM1674 RNA causes inhibition of translation of respective one or more VGAM1674 host target proteins.

[56556] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1674 gene, herein designated VGAM GENE, on one or more VGAM1674 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[56557] It is yet further appreciated that a function of VGAM1674 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1674 include diagnosis, prevention and treatment of viral infection by Tick-borne Encephalitis Virus. Specific functions, and accordingly utilities, of VGAM1674 correlate with, and may be deduced from, the identity of the host target genes which VGAM1674 binds and inhibits, and the function of these host target genes,

as elaborated hereinbelow.

[56558] Nucleotide sequences of the VGAM1674 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1674 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1674 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1674 are further described hereinbelow with reference to Table 1.

[56559] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1674 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1674 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[56560] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1674 gene, herein designated VGAM is inhibition of expression of VGAM1674 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1674 correlate with, and may be deduced from, the identity of the target genes which VGAM1674 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[56561] Ephrin-B1 (EFNB1, Accession NM\_004429) is a VGAM1674 host target gene. EFNB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EFNB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EFNB1 BINDING SITE, designated SEQ ID:10705, to the nucleotide sequence of VGAM1674 RNA, herein designated VGAM RNA, also designated SEQ ID:4385.

[56562] A function of VGAM1674 is therefore inhibition of Ephrin-B1 (EFNB1, Accession NM\_004429), a gene which is a transmembrane ligand of Eph-related receptor tyrosine kinases, has a role in cell adhesion. Accordingly, utilities of VGAM1674 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EFNB1. The function of EFNB1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM390. Peptidylprolyl Isomerase F (cyclophilin F) (PPIF, Accession NM\_005729) is another VGAM1674 host target gene. PPIF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region

of mRNA encoded by PPIF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPIF BINDING SITE, designated SEQ ID:12284, to the nucleotide sequence of VGAM1674 RNA, herein designated VGAM RNA, also designated SEQ ID:4385.

[56563] Another function of VGAM1674 is therefore inhibition of Peptidylprolyl Isomerase F (cyclophilin F) (PPIF, Accession NM\_005729), a gene which catalyzes the cis to trans isomerization of certain proline imidic peptide bonds in oligopeptides. Accordingly, utilities of VGAM1674 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPIF. The function of PPIF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM251. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1675 (VGAM1675) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[56564] VGAM1675 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1675 was detected is described hereinabove with reference to Figs. 1–8.

[56565] VGAM1675 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Viral Hemorrhagic Septicemia Virus. VGAM1675 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[56566] VGAM1675 gene encodes a VGAM1675 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1675 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1675 precursor RNA is designated SEQ ID:1661, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1661 is located at position 1531 relative to the genome of Viral Hemorrhagic Septicemia Virus.

[56567] VGAM1675 precursor RNA folds onto itself, forming VGAM1675 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[56568] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1675 folded precursor RNA into VGAM1675 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1675 RNA is designated SEQ ID:4386, and is provided hereinbelow with reference to the sequence listing part.

[56569] VGAM1675 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1675 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1675 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[56570] VGAM1675 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1675 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1675 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1675 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1675 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[56571] The complementary binding of VGAM1675 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1675 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1675 host target RNA into VGAM1675 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[56572] It is appreciated that VGAM1675 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1675 host target genes. The mRNA of each one of this plurality of VGAM1675 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1675 RNA, herein designated VGAM RNA, and which when bound by VGAM1675 RNA causes inhibition of translation of respective one or more VGAM1675 host target proteins.

[56573] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1675 gene, herein designated VGAM GENE, on one or more VGAM1675 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[56574] It is yet further appreciated that a function of VGAM1675 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1675 include diagnosis, prevention and treatment of viral infection by Viral Hemorrhagic Septicemia Virus. Specific functions, and accordingly utilities, of VGAM1675 correlate with, and may be deduced from, the identity of the host target genes which VGAM1675 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[56575] Nucleotide sequences of the VGAM1675 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the  
`diced` VGAM1675 RNA, herein designated VGAM RNA,  
and a schematic representation of the secondary folding  
of VGAM1675 folded precursor RNA, herein designated  
VGAM FOLDED PRECURSOR RNA, of VGAM1675 are further  
described hereinbelow with reference to Table 1.

[56576] Nucleotide sequences of host target binding sites, such as  
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of  
Fig. 1, found on VGAM1675 host target RNA, and  
schematic representation of the complementarity of each  
of these host target binding sites to VGAM1675 RNA,  
herein designated VGAM RNA, are described hereinbelow  
with reference to Table 2.

[56577] As mentioned hereinabove with reference to Fig. 1, a  
function of VGAM1675 gene, herein designated VGAM is  
inhibition of expression of VGAM1675 target genes. It is  
appreciated that specific functions, and accordingly utili-  
ties, of VGAM1675 correlate with, and may be deduced  
from, the identity of the target genes which VGAM1675  
binds and inhibits, and the function of these target genes,  
as elaborated hereinbelow.

[56578] RB1-inducible Coiled-coil 1 (RB1CC1, Accession  
NM\_014781) is a VGAM1675 host target gene. RB1CC1

BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RB1CC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RB1CC1 BINDING SITE, designated SEQ ID:16630, to the nucleotide sequence of VGAM1675 RNA, herein designated VGAM RNA, also designated SEQ ID:4386.

[56579] A function of VGAM1675 is therefore inhibition of RB1-inducible Coiled-coil 1 (RB1CC1, Accession NM\_014781), a gene which is likely to participate in nuclear architecture by connecting chromatin with the nuclear matrix or envelope. Accordingly, utilities of VGAM1675 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RB1CC1. The function of RB1CC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM18.BCE-1 (Accession NM\_007005) is another VGAM1675 host target gene. BCE-1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by BCE-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCE-1 BINDING SITE, designated SEQ ID:13867, to the nucleotide sequence of VGAM1675 RNA, herein designated VGAM RNA, also designated SEQ ID:4386.

[56580] Another function of VGAM1675 is therefore inhibition of BCE-1 (Accession NM\_007005). Accordingly, utilities of VGAM1675 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCE-1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1676 (VGAM1676) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[56581] VGAM1676 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1676 was detected is described hereinabove with reference to Figs. 1-8.

[56582] VGAM1676 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Viral Hemorrhagic Septicemia Virus. VGAM1676 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene con-

tained in the human genome.

[56583] VGAM1676 gene encodes a VGAM1676 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1676 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1676 precursor RNA is designated SEQ ID:1662, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1662 is located at position 7506 relative to the genome of Viral Hemorrhagic Septicemia Virus.

[56584] VGAM1676 precursor RNA folds onto itself, forming VGAM1676 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[56585] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1676 folded precursor RNA into VGAM1676 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide sequence of VGAM1676 RNA is designated SEQ ID:4387, and is provided hereinbelow with reference to the sequence listing part.

[56586] VGAM1676 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1676 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1676 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[56587] VGAM1676 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1676 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1676 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1676 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1676 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[56588] The complementary binding of VGAM1676 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1676 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1676 host target RNA into VGAM1676 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[56589] It is appreciated that VGAM1676 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1676 host target genes. The mRNA of each one of this plurality of VGAM1676 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1676 RNA, herein designated VGAM RNA, and which when bound by VGAM1676 RNA causes inhibition of translation of respective one or more VGAM1676 host target proteins.

[56590] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1676 gene, herein designated VGAM GENE, on one or more VGAM1676 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[56591] It is yet further appreciated that a function of VGAM1676 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1676 include diagnosis, prevention and treatment of viral infection by Viral Hemorrhagic Septicemia Virus. Specific functions, and accordingly utilities, of VGAM1676 correlate with, and may be deduced from, the identity of the host target genes which VGAM1676 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[56592] Nucleotide sequences of the VGAM1676 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1676 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1676 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1676 are further described hereinbelow with reference to Table 1.

[56593] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM1676 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1676 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[56594] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1676 gene, herein designated VGAM is inhibition of expression of VGAM1676 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1676 correlate with, and may be deduced from, the identity of the target genes which VGAM1676 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[56595] Glycosylphosphatidylinositol Specific Phospholipase D1 (GPLD1, Accession XM\_166347) is a VGAM1676 host target gene. GPLD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPLD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPLD1 BINDING SITE, designated SEQ ID:44181, to the nucleotide sequence of VGAM1676 RNA, herein designated VGAM RNA, also designated SEQ

ID:4387.

[56596] A function of VGAM1676 is therefore inhibition of Glycosylphosphatidylinositol Specific Phospholipase D1 (GPLD1, Accession XM\_166347), a gene which hydrolyses the inositol phosphate linkage in proteins anchored by phosphatidylinositol glycans to release these proteins from the membrane. Accordingly, utilities of VGAM1676 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPLD1. The function of GPLD1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1575. Polymerase (DNA directed), Theta (POLQ, Accession NM\_006596) is another VGAM1676 host target gene. POLQ BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by POLQ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POLQ BINDING SITE, designated SEQ ID:13365, to the nucleotide sequence of VGAM1676 RNA, herein designated VGAM RNA, also designated SEQ ID:4387.

[56597] Another function of VGAM1676 is therefore inhibition of

Polymerase (DNA directed), Theta (POLQ, Accession NM\_006596), a gene which enhances untargeted mutagenesis. Accordingly, utilities of VGAM1676 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POLQ. The function of POLQ and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM922.SET Translocation (myeloid leukemia-associated) (SET, Accession NM\_003011) is another VGAM1676 host target gene. SET BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SET, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SET BINDING SITE, designated SEQ ID:8920, to the nucleotide sequence of VGAM1676 RNA, herein designated VGAM RNA, also designated SEQ ID:4387.

[56598] Another function of VGAM1676 is therefore inhibition of SET Translocation (myeloid leukemia-associated) (SET, Accession NM\_003011). Accordingly, utilities of VGAM1676 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SET.

Transforming Growth Factor, Beta 3 (TGFB3, Accession NM\_003239) is another VGAM1676 host target gene. TGFB3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TGFB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TGFB3 BINDING SITE, designated SEQ ID:9234, to the nucleotide sequence of VGAM1676 RNA, herein designated VGAM RNA, also designated SEQ ID:4387.

[56599] Another function of VGAM1676 is therefore inhibition of Transforming Growth Factor, Beta 3 (TGFB3, Accession NM\_003239), a gene which is involved in embryogenesis and cell differentiation. Accordingly, utilities of VGAM1676 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGFB3. The function of TGFB3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1126.caspr5 (Accession NM\_138996) is another VGAM1676 host target gene. caspr5 BINDING SITE1 and caspr5 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by

caspr5, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of caspr5 BINDING SITE1 and caspr5 BINDING SITE2, designated SEQ ID:29095 and SEQ ID:28266 respectively, to the nucleotide sequence of VGAM1676 RNA, herein designated VGAM RNA, also designated SEQ ID:4387.

[56600] Another function of VGAM1676 is therefore inhibition of caspr5 (Accession NM\_138996). Accordingly, utilities of VGAM1676 include diagnosis, prevention and treatment of diseases and clinical conditions associated with caspr5. KIAA0937 (Accession XM\_166213) is another VGAM1676 host target gene. KIAA0937 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0937, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0937 BINDING SITE, designated SEQ ID:44015, to the nucleotide sequence of VGAM1676 RNA, herein designated VGAM RNA, also designated SEQ ID:4387.

[56601] Another function of VGAM1676 is therefore inhibition of

KIAA0937 (Accession XM\_166213). Accordingly, utilities of VGAM1676 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0937. Lymphocyte Antigen 75 (LY75, Accession NM\_002349) is another VGAM1676 host target gene. LY75 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LY75, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LY75 BINDING SITE, designated SEQ ID:8150, to the nucleotide sequence of VGAM1676 RNA, herein designated VGAM RNA, also designated SEQ ID:4387.

[56602] Another function of VGAM1676 is therefore inhibition of Lymphocyte Antigen 75 (LY75, Accession NM\_002349). Accordingly, utilities of VGAM1676 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LY75. Organic Cationic Transporter-like 3 (ORCTL3, Accession NM\_004256) is another VGAM1676 host target gene. ORCTL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ORCTL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ORCTL3 BINDING SITE, designated SEQ ID:10444, to the nucleotide sequence of VGAM1676 RNA, herein designated VGAM RNA, also designated SEQ ID:4387.

[56603] Another function of VGAM1676 is therefore inhibition of Organic Cationic Transporter-like 3 (ORCTL3, Accession NM\_004256). Accordingly, utilities of VGAM1676 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ORCTL3. Tripartite Motif-containing 4 (TRIM4, Accession NM\_033017) is another VGAM1676 host target gene. TRIM4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRIM4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM4 BINDING SITE, designated SEQ ID:26903, to the nucleotide sequence of VGAM1676 RNA, herein designated VGAM RNA, also designated SEQ ID:4387.

[56604] Another function of VGAM1676 is therefore inhibition of Tripartite Motif-containing 4 (TRIM4, Accession NM\_033017). Accordingly, utilities of VGAM1676 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM4. LOC127702 (Accession XM\_060619) is another VGAM1676 host target gene. LOC127702 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC127702, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC127702 BINDING SITE, designated SEQ ID:37182, to the nucleotide sequence of VGAM1676 RNA, herein designated VGAM RNA, also designated SEQ ID:4387.

[56605] Another function of VGAM1676 is therefore inhibition of LOC127702 (Accession XM\_060619). Accordingly, utilities of VGAM1676 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC127702. LOC143310 (Accession XM\_084485) is another VGAM1676 host target gene. LOC143310 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC143310, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC143310 BINDING SITE, designated SEQ ID:37603, to the nucleotide sequence of VGAM1676 RNA, herein designated VGAM RNA, also designated SEQ ID:4387.

[56606] Another function of VGAM1676 is therefore inhibition of LOC143310 (Accession XM\_084485). Accordingly, utilities of VGAM1676 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143310. LOC144262 (Accession XM\_084793) is another VGAM1676 host target gene. LOC144262 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC144262, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144262 BINDING SITE, designated SEQ ID:37705, to the nucleotide sequence of VGAM1676 RNA, herein designated VGAM RNA, also designated SEQ ID:4387.

[56607] Another function of VGAM1676 is therefore inhibition of LOC144262 (Accession XM\_084793). Accordingly, utilities of VGAM1676 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144262. LOC144519 (Accession XM\_084890) is another VGAM1676 host target gene. LOC144519 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC144519, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144519 BINDING SITE, designated SEQ ID:37754, to the nucleotide sequence of VGAM1676 RNA, herein designated VGAM RNA, also designated SEQ ID:4387.

[56608] Another function of VGAM1676 is therefore inhibition of LOC144519 (Accession XM\_084890). Accordingly, utilities of VGAM1676 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144519. LOC145790 (Accession XM\_085234) is another VGAM1676 host target gene. LOC145790 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC145790, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145790 BINDING SITE, designated SEQ ID:37978, to the nucleotide sequence of VGAM1676 RNA, herein designated VGAM RNA, also designated SEQ ID:4387.

[56609] Another function of VGAM1676 is therefore inhibition of

LOC145790 (Accession XM\_085234). Accordingly, utilities of VGAM1676 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145790. LOC164382 (Accession XM\_104390) is another VGAM1676 host target gene. LOC164382 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC164382, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC164382 BINDING SITE, designated SEQ ID:42165, to the nucleotide sequence of VGAM1676 RNA, herein designated VGAM RNA, also designated SEQ ID:4387.

[56610] Another function of VGAM1676 is therefore inhibition of LOC164382 (Accession XM\_104390). Accordingly, utilities of VGAM1676 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC164382. LOC168346 (Accession XM\_095010) is another VGAM1676 host target gene. LOC168346 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC168346, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC168346 BINDING SITE, designated SEQ ID:40241, to the nucleotide sequence of VGAM1676 RNA, herein designated VGAM RNA, also designated SEQ ID:4387.

[56611] Another function of VGAM1676 is therefore inhibition of LOC168346 (Accession XM\_095010). Accordingly, utilities of VGAM1676 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC168346. LOC197117 (Accession XM\_116989) is another VGAM1676 host target gene. LOC197117 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC197117, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197117 BINDING SITE, designated SEQ ID:43195, to the nucleotide sequence of VGAM1676 RNA, herein designated VGAM RNA, also designated SEQ ID:4387.

[56612] Another function of VGAM1676 is therefore inhibition of LOC197117 (Accession XM\_116989). Accordingly, utilities of VGAM1676 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197117. LOC255645 (Accession XM\_172967) is an-

other VGAM1676 host target gene. LOC255645 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255645, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255645 BINDING SITE, designated SEQ ID:46223, to the nucleotide sequence of VGAM1676 RNA, herein designated VGAM RNA, also designated SEQ ID:4387.

[56613] Another function of VGAM1676 is therefore inhibition of LOC255645 (Accession XM\_172967). Accordingly, utilities of VGAM1676 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255645. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1677 (VGAM1677) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[56614] VGAM1677 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1677 was detected is de-

scribed hereinabove with reference to Figs. 1–8.

[56615] VGAM1677 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Viral Hemorrhagic Septicemia Virus. VGAM1677 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[56616] VGAM1677 gene encodes a VGAM1677 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1677 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1677 precursor RNA is designated SEQ ID:1663, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1663 is located at position 5586 relative to the genome of Viral Hemorrhagic Septicemia Virus.

[56617] VGAM1677 precursor RNA folds onto itself, forming VGAM1677 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[56618] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1677 folded precursor RNA into VGAM1677 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM1677 RNA is designated SEQ ID:4388, and is provided hereinbelow with reference to the sequence listing part.

[56619] VGAM1677 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1677 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1677 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[56620] VGAM1677 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1677 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1677 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1677 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1677 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[56621] The complementary binding of VGAM1677 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1677 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1677 host target RNA into VGAM1677 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[56622] It is appreciated that VGAM1677 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1677 host target genes. The mRNA of each one of this plurality of VGAM1677 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1677 RNA, herein designated VGAM RNA, and which when bound by VGAM1677 RNA causes inhibition of translation of respective one or more VGAM1677 host target proteins.

[56623] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1677 gene, herein designated VGAM GENE, on one or more VGAM1677 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[56624] It is yet further appreciated that a function of VGAM1677 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1677 include diagnosis, prevention and treatment of viral infection by Viral Hemorrhagic Septicemia Virus. Specific functions, and accordingly utilities, of VGAM1677 correlate with, and may be deduced from, the identity of the host target genes which VGAM1677 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[56625] Nucleotide sequences of the VGAM1677 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1677 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM1677 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1677 are further described hereinbelow with reference to Table 1.

[56626] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1677 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1677 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[56627] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1677 gene, herein designated VGAM is inhibition of expression of VGAM1677 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1677 correlate with, and may be deduced from, the identity of the target genes which VGAM1677 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[56628] Cytochrome P450, 51 (lanosterol 14- $\alpha$ -demethylase) (CYP51, Accession NM\_000786) is a VGAM1677 host target gene. CYP51 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CYP51, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP51 BINDING SITE, designated SEQ ID:6436, to the nucleotide sequence of VGAM1677 RNA, herein designated VGAM RNA, also designated SEQ ID:4388.

[56629] A function of VGAM1677 is therefore inhibition of Cytochrome P450, 51 (lanosterol 14- $\alpha$ -demethylase) (CYP51, Accession NM\_000786). Accordingly, utilities of VGAM1677 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP51. Deoxyribonuclease I-like 1 (DNASE1L1, Accession NM\_006730) is another VGAM1677 host target gene. DNASE1L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DNASE1L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNASE1L1 BINDING SITE, designated SEQ ID:13566, to the nucleotide sequence of VGAM1677 RNA, herein designated VGAM RNA, also designated SEQ ID:4388.

[56630] Another function of VGAM1677 is therefore inhibition of

Deoxyribonuclease I-like 1 (DNASE1L1, Accession NM\_006730), a gene which seems to be involved in cell death. Accordingly, utilities of VGAM1677 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNASE1L1. The function of DNASE1L1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM885. ELK3, ETS-domain Protein (SRF accessory protein 2) (ELK3, Accession NM\_005230) is another VGAM1677 host target gene. ELK3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ELK3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ELK3 BINDING SITE, designated SEQ ID:11733, to the nucleotide sequence of VGAM1677 RNA, herein designated VGAM RNA, also designated SEQ ID:4388.

[56631] Another function of VGAM1677 is therefore inhibition of ELK3, ETS-domain Protein (SRF accessory protein 2) (ELK3, Accession NM\_005230), a gene which may be a negative regulator of transcription but can activate transcription

when coexpressed with ras, src or mos. Accordingly, utilities of VGAM1677 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ELK3. The function of ELK3 has been established by previous studies. The ETS gene family encodes a group of proteins that function as transcription factors under physiologic conditions and, if aberrantly expressed, can cause cellular transformation. Lopez et al. (1994) cloned the gene for a new ETS-related transcription factor, which they called ERP for 'ETS-related protein,' from a murine pre-B cell line and from lung tissue. The ERP protein contained a region of high homology with the ETS DNA-binding domain common to all members of the ETS transcription factor/oncoprotein family. Within the B-cell lineage, ERP is highly expressed primarily at early stages of B-lymphocyte development, and expression declines drastically upon B-cell maturation, correlating with the activity of the enhancer of immunoglobulin heavy chain. The data suggested that ERP plays a role in both B-cell development and IgH gene regulation. Giovane et al. (1994) identified the same ETS family member, which they designated Net, from Ras-transformed mouse fibroblasts using PCR primers based on the nucleotide sequence cor-

responding to the most conserved amino acids of the ETS domain. They subsequently obtained a complete cDNA sequence. The predicted Net protein contains an ETS domain at the amino terminus that is about 80% similar to the human ELK1 (OMIM Ref. No. 311040) and ELK4 (OMIM Ref. No. 600246) sequences. The authors noted that 2 other domains also show significant similarity to regions of these proteins, and that the 3 genes clearly belong to the ELK family. Two mRNAs of 2.5 and 4.5 kb were detected by Northern blotting. Transcripts were found, at varying levels, in a large number of transformed cell lines and tissues. The authors showed that Net protein bound to ETS DNA motifs and could form complexes with SRF (OMIM Ref. No. 600589) on the fos serum response element. Using fluorescence in situ hybridization, Shipley et al. (1994) mapped ELK4 and ELK3 to 1q32 and 12q23, respectively. (The authors referred to ELK4 as SAP1 and to ELK3 as SAP2.) Tamai et al. (1995) mapped the Elk3 gene to mouse chromosome 10 and suggested that the human homolog (ELK3) may be located on 12q in the interval between bands q21 and q24 because of established homology of synteny with the mid-distal region of mouse chromosome 10. Giovane et al. (1995) mapped ELK3 to human

12q22–q23 and to mouse 10C–D1 by in situ hybridization.

[56632] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[56633] Giovane, A.; Pintzas, A.; Maira, S.–M.; Sobieszczuk, P.; Wasylyk, B. : Net, a new ets transcription factor that is activated by Ras. *Genes Dev.* 8: 1502–1513, 1994. ; and

[56634] Giovane, A.; Sobieszczuk, P.; Mignon, C.; Mattei, M.–G.; Wasylyk, B. : Locations of the ets subfamily members net, elk1, and sap1 (ELK3, ELK1, and ELK4) on three homologous regions of t.

[56635] Further studies establishing the function and utilities of ELK3 are found in John Hopkins OMIM database record ID 600247, and in cited publications numbered 7921, 862 and 8630 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Ectonucleotide Pyrophosphatase/phosphodiesterase 3 (ENPP3, Accession NM\_005021) is another VGAM1677 host target gene. ENPP3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ENPP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ENPP3 BINDING SITE, designated SEQ ID:11462, to the nucleotide sequence of VGAM1677 RNA, herein designated VGAM RNA, also designated SEQ ID:4388.

[56636] Another function of VGAM1677 is therefore inhibition of Ectonucleotide Pyrophosphatase/phosphodiesterase 3 (ENPP3, Accession NM\_005021). Accordingly, utilities of VGAM1677 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ENPP3. Glucagon Receptor (GCGR, Accession NM\_000160) is another VGAM1677 host target gene. GCGR BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GCGR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GCGR BINDING SITE, designated SEQ ID:5664, to the nucleotide sequence of VGAM1677 RNA, herein designated VGAM RNA, also designated SEQ ID:4388.

[56637] Another function of VGAM1677 is therefore inhibition of Glucagon Receptor (GCGR, Accession NM\_000160), a gene which controls the rate of hepatic glucose production and

insulin secretion. Accordingly, utilities of VGAM1677 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GCGR. The function of GCGR has been established by previous studies. Hager et al. (1995) reported the association of a single heterozygous gly-to-ser missense mutation in the glucagon receptor gene with late-onset noninsulin-dependent diabetes mellitus (OMIM Ref. No. 125853). In a pooled set of French and Sardinian patients, the gly40-to-ser mutation showed association with NIDDM (chi square = 14.4,  $P = 0.0001$ ). In 18 sibships from 9 French pedigrees, some evidence for linkage to diabetes was found. Receptor binding studies using cultured cells expressing the gly40-to-ser mutation demonstrated that this mutation results in a receptor that binds glucagon with a 3-fold lower affinity compared to the wildtype receptor. The physiologic effects of glucagon (GCG; 138030) are mediated through the glucagon receptor, a 480-amino acid protein that is a member of the superfamily of receptors characterized by a 7 transmembrane domain structure and by their coupling via GTP-binding proteins (G-proteins) to adenyl cyclase. Menzel et al. (1994) cloned human glucagon receptor cDNA and demonstrated 85%

nucleotide and 91% amino acid identity with the rat sequence. By fluorescence in situ hybridization, they localized the GCGR gene to 17q25. An Alu variable poly(A) DNA polymorphism was identified in the gene. Use of the polymorphism in a study of CEPH families showed linkage between the polymorphism and markers localized to distal 17q. The receptor for glucagon-like peptide-1 (GLP1R; 138032), which is derived from the same preproglucagon molecule, has structural similarities but does not bind peptides of related structure and similar function, such as glucagon. Lok et al. (1994) isolated a cDNA encoding a complete functional human glucagon receptor from a liver cDNA library by a combination of polymerase chain reaction and colony hybridization. The cDNA encoded a protein that had 80% identity to rat glucagon receptor, bound (125-I)-labeled glucagon, and transduced a signal leading to increases in the concentration of intracellular cyclic AMP. Southern blot analysis of human DNA suggested the presence of a single GCGR locus. By in situ hybridization, Lok et al. (1994) mapped the GCGR locus to 17q25. Analysis of the genomic sequence showed that the coding region spans over 5.5 kb and is interrupted by 12 introns.

[56638] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[56639] Hager, J.; Hansen, L.; Vaisse, C.; Vionnet, N.; Philippi, A.; Poller, W.; Velho, G.; Carcassi, C.; Contu, L.; Julier, C.; Cambien, F.; Passa, P.; Lathrop, M.; Kindsvogel, W.; Deme-nais, F.; Nishimura, E.; Froguel, P. : A missense mutation in the glucagon receptor gene is associated with non-insulin-dependent diabetes mellitus. *Nature Genet.* 9: 299-304, 1995. ; and

[56640] Lok, S.; Kuijper, J. L.; Jelinek, L. J.; Kramer, J. M.; Whitmore, T. E.; Sprecher, C. A.; Mathewes, S.; Grant, F. J.; Biggs, S. H.; Rosenberg, G. B.; Sheppard, P. O.; O'Hara, P. J.; Fos.

[56641] Further studies establishing the function and utilities of GCGR are found in John Hopkins OMIM database record ID 138033, and in cited publications numbered 335 and 3359-3361 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Glutamate Receptor, Ionotropic, Kainate 3 (GRIK3, Accession NM\_000831) is another VGAM1677 host target gene. GRIK3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GRIK3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of GRIK3 BINDING SITE, designated SEQ ID:6485, to the nucleotide sequence of VGAM1677 RNA, herein designated VGAM RNA, also designated SEQ ID:4388.

[56642] Another function of VGAM1677 is therefore inhibition of Glutamate Receptor, Ionotropic, Kainate 3 (GRIK3, Accession NM\_000831). Accordingly, utilities of VGAM1677 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRIK3. Intercellular Adhesion Molecule 1 (CD54), Human Rhinovirus Receptor (ICAM1, Accession XM\_049518) is another VGAM1677 host target gene. ICAM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ICAM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ICAM1 BINDING SITE, designated SEQ ID:35442, to the nucleotide sequence of VGAM1677 RNA, herein designated VGAM RNA, also designated SEQ ID:4388.

[56643] Another function of VGAM1677 is therefore inhibition of Intercellular Adhesion Molecule 1 (CD54), Human Rhi-

novirus Receptor (ICAM1, Accession XM\_049518), a gene which binds the integrin LFA-1 (ITGB2) and promotes adhesion; member of the immunoglobulin superfamily. Accordingly, utilities of VGAM1677 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ICAM1. The function of ICAM1 has been established by previous studies. Intercellular adhesion molecule-1 (ICAM1) is a ligand for lymphocyte-function associated (LFA) antigens (see OMIM Ref. No. 116920). Simmons et al. (1988) analyzed a cDNA clone of the ICAM1 gene and found that it showed homology to the neural cell adhesion molecule NCAM (OMIM Ref. No. 116930). Greve et al. (1989) demonstrated that the ICAM1 protein is the major human rhinovirus receptor. Bella et al. (1998) analyzed the structural features of the ICAM1 molecule that underlie its function as a receptor for the major group of human rhinoviruses and as a ligand for LFA-1. Expression of HLA-DR antigen (see OMIM Ref. No. 142860) and ICAM1 in human conjunctival epithelium is upregulated in patients with dry eyes associated with Sjogren syndrome (OMIM Ref. No. 270150). Tsubota et al. (1999) reported that this upregulation in Sjogren syndrome patients may be controlled by interferon-gamma

(OMIM Ref. No. 147570) through the activation of transcription factor NF $\kappa$ B (nuclear OMIM Ref. No. 164011). Pisella et al. (2000) reported that a significant increase of HLA-DR and ICAM1 expression by epithelial cells was consistently found in patients with keratoconjunctivitis sicca (Sjogren syndrome) compared with expression in normal eyes. These 2 markers were well correlated with each other and correlated inversely with tear break-up time and tear production as measured by the Schirmer test. The percentage of conjunctival goblet cells was significantly decreased in dry eye patients with a significant negative correlation with both HLA-DR and ICAM1 markers. Lu and Cyster (2002) studied the mechanisms that control localization of marginal zone B cells. They demonstrated that marginal zone B cells express elevated levels of the integrins LFA-1 (see OMIM Ref. No. 153370) and alpha-4-beta-1 (see OMIM Ref. No. 192975 and 135630), and that the marginal zone B cells bind to the ligands ICAM1 and VCAM1 (OMIM Ref. No. 192225). These ligands are expressed within the marginal zone in a lymphotoxin-dependent manner. Combined inhibition of LFA-1 and alpha-4-beta-1 causes a rapid and selective release of B cells from the marginal zone. Furthermore, lipopolysac-

charide-triggered marginal zone B cell relocation involves downregulation of integrin-mediated adhesion. Lu and Cyster (2002) concluded that their studies identified key requirements for marginal zone B cell localization and established a role for integrins in peripheral lymphoid tissue compartmentalization. Animal model experiments lend further support to the function of ICAM1. To test the role of Icam1 in intact animals, Sligh et al. (1993) disrupted the gene in murine embryonic stem cells by gene targeting. Homozygous deficient animals developed normally, were fertile, and had a moderate granulocytosis. Studies were consistent with complete loss of surface expression of the protein. Deficient mice exhibited prominent abnormalities of inflammatory responses including impaired neutrophil emigration in response to chemical peritonitis and decreased contact hypersensitivity to 2,4-dinitrofluorobenzene. Mutant cells provided negligible stimulation in the mixed lymphocyte reaction, although they proliferated normally as responder cells

[56644] It is appreciated that the abovementioned animal model for ICAM1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

- [56645] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [56646] Sligh, J. E., Jr.; Ballantyne, C. M.; Rich, S. S.; Hawkins, H. K.; Smith, C. W.; Bradley, A.; Beaudet, A. L. : Inflammatory and immune responses are impaired in mice deficient in inter-cellular adhesion molecule 1. Proc. Nat. Acad. Sci. 90: 8529–8533, 1993. ; and
- [56647] Lu, T. T.; Cyster, J. G. : Integrin-mediated long-term B cell retention in the splenic marginal zone. Science 297: 409–412, 2002.
- [56648] Further studies establishing the function and utilities of ICAM1 are found in John Hopkins OMIM database record ID 147840, and in cited publications numbered 3045–3054, 11448, 4813, 3912, 471 and 11450 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. MAX Binding Protein (MNT, Accession NM\_020310) is another VGAM1677 host target gene. MNT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MNT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of MNT BINDING SITE, designated SEQ ID:21559, to the nucleotide sequence of VGAM1677 RNA, herein designated VGAM RNA, also designated SEQ ID:4388.

[56649] Another function of VGAM1677 is therefore inhibition of MAX Binding Protein (MNT, Accession NM\_020310). Accordingly, utilities of VGAM1677 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MNT. Nitric Oxide Synthase 1 (neuronal) (NOS1, Accession NM\_000620) is another VGAM1677 host target gene. NOS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NOS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NOS1 BINDING SITE, designated SEQ ID:6230, to the nucleotide sequence of VGAM1677 RNA, herein designated VGAM RNA, also designated SEQ ID:4388.

[56650] Another function of VGAM1677 is therefore inhibition of Nitric Oxide Synthase 1 (neuronal) (NOS1, Accession NM\_000620), a gene which produces nitric oxide (no) which is a messenger molecule with diverse functions

throughout the body. Accordingly, utilities of VGAM1677 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NOS1. The function of NOS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM323. Amino peptidase Puromycin Sensitive (NPEPPS, Accession NM\_006310) is another VGAM1677 host target gene. NPEPPS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NPEPPS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NPEPPS BINDING SITE, designated SEQ ID:12997, to the nucleotide sequence of VGAM1677 RNA, herein designated VGAM RNA, also designated SEQ ID:4388.

[56651] Another function of VGAM1677 is therefore inhibition of Amino peptidase Puromycin Sensitive (NPEPPS, Accession NM\_006310), a gene which is puromycin-sensitive aminopeptidase and has metallopeptidase activity. Accordingly, utilities of VGAM1677 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with NPEPPS. The function of NPEPPS and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM83. Neurogranin (protein kinase C substrate, RC3) (NRGN, Accession NM\_006176) is another VGAM1677 host target gene. NRGN BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NRGN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NRGN BINDING SITE, designated SEQ ID:12835, to the nucleotide sequence of VGAM1677 RNA, herein designated VGAM RNA, also designated SEQ ID:4388.

[56652] Another function of VGAM1677 is therefore inhibition of Neurogranin (protein kinase C substrate, RC3) (NRGN, Accession NM\_006176), a gene which acts as a "third messenger" substrate of protein kinase c-mediated molecular cascades during synaptic development and remodeling. Accordingly, utilities of VGAM1677 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NRGN. The function of NRGN has been established by previous studies. Neurogranin is a

brain-specific protein expressed in telencephalic neurons. Neurogranin was first identified by Baudier et al. (1991) from bovine forebrain. Baudier et al. (1991) showed that, like GAP43 (OMIM Ref. No. 162060), rat neurogranin, also called p17 or RC3, is phosphorylated by protein kinase C (see OMIM Ref. No. 176960) and binds calmodulin in the absence of calcium. Martinez de Arrieta et al. (1997) cloned human neurogranin by screening a placental genomic library with the homologous rat cDNA. The 78-amino acid human protein is 96% identical to rat neurogranin. On Northern blots of human tissues, Martinez de Arrieta et al. (1997) detected neurogranin expression only in brain. Martinez de Arrieta et al. (1997) localized the neurogranin gene to 11q24 based on its inclusion within a YAC from that region. In the rat brain, neurogranin is under thyroid hormone control in specific neuronal subsets in both developing and adult animals. To evaluate whether the human gene is also a target of thyroid hormone, Martinez de Arrieta et al. (1999) searched for T3-responsive elements in NRGN cloned genomic fragments spanning the whole gene. A T3 receptor-binding site was found in the first intron, 3,000 bp downstream from the origin of transcription. Further data re-

ported by Martinez de Arrieta et al. (1999) suggested that NRGN is a direct target for thyroid hormone in human brain, and that control of expression of this gene could underlay many of the consequences of hypothyroidism on mental states during development as well as in adult subjects.

[56653] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[56654] Baudier, J.; Deloulme, J. C.; Van Dorsselaer, A.; Black, D.; Matthes, H. W. D. : Purification and characterization of a brain-specific protein kinase C substrate, neurogranin (p17): identification of a consensus amino acid sequence between neurogranin and neuromodulin (GAP43) that corresponds to the protein kinase C phosphorylation site and the calmodulin-binding domain. J. Biol. Chem. 266: 229-237, 1991. ; and

[56655] Martinez de Arrieta, C.; Morte, B.; Coloma, A.; Bernal, J. : The human RC3 gene homolog, NRGN contains a thyroid hormone-responsive element located in the first intron. Endocrinology 14.

[56656] Further studies establishing the function and utilities of NRGN are found in John Hopkins OMIM database record ID

602350, and in cited publications numbered 1017–1014 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. P53AIP1 (Accession NM\_022112) is another VGAM1677 host target gene.

P53AIP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by P53AIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P53AIP1 BINDING SITE, designated SEQ ID:22659, to the nucleotide sequence of VGAM1677 RNA, herein designated VGAM RNA, also designated SEQ ID:4388.

[56657] Another function of VGAM1677 is therefore inhibition of P53AIP1 (Accession NM\_022112). Accordingly, utilities of VGAM1677 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P53AIP1. Polycystic Kidney and Hepatic Disease 1 (autosomal recessive) (PKHD1, Accession NM\_138694) is another VGAM1677 host target gene. PKHD1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PKHD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND–

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PKHD1 BINDING SITE, designated SEQ ID:28940, to the nucleotide sequence of VGAM1677 RNA, herein designated VGAM RNA, also designated SEQ ID:4388.

[56658] Another function of VGAM1677 is therefore inhibition of Polycystic Kidney and Hepatic Disease 1 (autosomal recessive) (PKHD1, Accession NM\_138694). Accordingly, utilities of VGAM1677 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PKHD1. Vasoactive Intestinal Peptide Receptor 1 (VIPR1, Accession NM\_004624) is another VGAM1677 host target gene. VIPR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VIPR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VIPR1 BINDING SITE, designated SEQ ID:10995, to the nucleotide sequence of VGAM1677 RNA, herein designated VGAM RNA, also designated SEQ ID:4388.

[56659] Another function of VGAM1677 is therefore inhibition of Vasoactive Intestinal Peptide Receptor 1 (VIPR1, Accession

NM\_004624), a gene which binds vip and is mediated by g proteins which activate adenylyl cyclase. Accordingly, utilities of VGAM1677 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VIPR1. The function of VIPR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM548. Apolipoprotein L, 6 (APOL6, Accession NM\_030641) is another VGAM1677 host target gene. APOL6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by APOL6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APOL6 BINDING SITE, designated SEQ ID:24970, to the nucleotide sequence of VGAM1677 RNA, herein designated VGAM RNA, also designated SEQ ID:4388.

[56660] Another function of VGAM1677 is therefore inhibition of Apolipoprotein L, 6 (APOL6, Accession NM\_030641). Accordingly, utilities of VGAM1677 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APOL6. FLJ20435 (Accession NM\_017821)

is another VGAM1677 host target gene. FLJ20435 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20435, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20435 BINDING SITE, designated SEQ ID:19468, to the nucleotide sequence of VGAM1677 RNA, herein designated VGAM RNA, also designated SEQ ID:4388.

[56661] Another function of VGAM1677 is therefore inhibition of FLJ20435 (Accession NM\_017821). Accordingly, utilities of VGAM1677 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20435. KIAA0247 (Accession NM\_014734) is another VGAM1677 host target gene. KIAA0247 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0247, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0247 BINDING SITE, designated SEQ ID:16373, to the nucleotide sequence of VGAM1677 RNA, herein designated VGAM RNA, also designated SEQ ID:4388.

[56662] Another function of VGAM1677 is therefore inhibition of KIAA0247 (Accession NM\_014734). Accordingly, utilities of VGAM1677 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0247. KIAA0368 (Accession XM\_036708) is another VGAM1677 host target gene. KIAA0368 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0368, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0368 BINDING SITE, designated SEQ ID:32490, to the nucleotide sequence of VGAM1677 RNA, herein designated VGAM RNA, also designated SEQ ID:4388.

[56663] Another function of VGAM1677 is therefore inhibition of KIAA0368 (Accession XM\_036708). Accordingly, utilities of VGAM1677 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0368. MGC11115 (Accession NM\_032310) is another VGAM1677 host target gene. MGC11115 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC11115, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC11115 BINDING SITE, designated SEQ ID:26099, to the nucleotide sequence of VGAM1677 RNA, herein designated VGAM RNA, also designated SEQ ID:4388.

[56664] Another function of VGAM1677 is therefore inhibition of MGC11115 (Accession NM\_032310). Accordingly, utilities of VGAM1677 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC11115. Nucleoredoxin (NXN, Accession NM\_022463) is another VGAM1677 host target gene. NXN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NXN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NXN BINDING SITE, designated SEQ ID:22807, to the nucleotide sequence of VGAM1677 RNA, herein designated VGAM RNA, also designated SEQ ID:4388.

[56665] Another function of VGAM1677 is therefore inhibition of Nucleoredoxin (NXN, Accession NM\_022463). Accordingly, utilities of VGAM1677 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with NXN. Neurexophilin 3 (NXPH3, Accession XM\_037847) is another VGAM1677 host target gene. NXPH3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NXPH3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NXPH3 BINDING SITE, designated SEQ ID:32717, to the nucleotide sequence of VGAM1677 RNA, herein designated VGAM RNA, also designated SEQ ID:4388.

[56666] Another function of VGAM1677 is therefore inhibition of Neurexophilin 3 (NXPH3, Accession XM\_037847). Accordingly, utilities of VGAM1677 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NXPH3. poly(rC) Binding Protein 3 (PCBP3, Accession NM\_020528) is another VGAM1677 host target gene. PCBP3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCBP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCBP3 BINDING SITE, designated SEQ

ID:21751, to the nucleotide sequence of VGAM1677 RNA, herein designated VGAM RNA, also designated SEQ ID:4388.

[56667] Another function of VGAM1677 is therefore inhibition of poly(rC) Binding Protein 3 (PCBP3, Accession NM\_020528). Accordingly, utilities of VGAM1677 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCBP3. Retinoic Acid Induced 15 (RAI15, Accession XM\_039548) is another VGAM1677 host target gene. RAI15 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAI15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAI15 BINDING SITE, designated SEQ ID:33119, to the nucleotide sequence of VGAM1677 RNA, herein designated VGAM RNA, also designated SEQ ID:4388.

[56668] Another function of VGAM1677 is therefore inhibition of Retinoic Acid Induced 15 (RAI15, Accession XM\_039548). Accordingly, utilities of VGAM1677 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAI15. Sideroflexin 5 (SFXN5, Acces-

sion NM\_144579) is another VGAM1677 host target gene. SFXN5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SFXN5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFXN5 BINDING SITE, designated SEQ ID:29388, to the nucleotide sequence of VGAM1677 RNA, herein designated VGAM RNA, also designated SEQ ID:4388.

[56669] Another function of VGAM1677 is therefore inhibition of Sideroflexin 5 (SFXN5, Accession NM\_144579). Accordingly, utilities of VGAM1677 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFXN5. SMOC1 (Accession NM\_022137) is another VGAM1677 host target gene. SMOC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SMOC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMOC1 BINDING SITE, designated SEQ ID:22700, to the nucleotide sequence of VGAM1677 RNA, herein designated VGAM RNA,

also designated SEQ ID:4388.

[56670] Another function of VGAM1677 is therefore inhibition of SMOC1 (Accession NM\_022137). Accordingly, utilities of VGAM1677 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMOC1. LOC144519 (Accession XM\_084890) is another VGAM1677 host target gene. LOC144519 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC144519, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144519 BINDING SITE, designated SEQ ID:37759, to the nucleotide sequence of VGAM1677 RNA, herein designated VGAM RNA, also designated SEQ ID:4388.

[56671] Another function of VGAM1677 is therefore inhibition of LOC144519 (Accession XM\_084890). Accordingly, utilities of VGAM1677 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144519. LOC144866 (Accession XM\_096699) is another VGAM1677 host target gene. LOC144866 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC144866, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144866 BINDING SITE, designated SEQ ID:40477, to the nucleotide sequence of VGAM1677 RNA, herein designated VGAM RNA, also designated SEQ ID:4388.

[56672] Another function of VGAM1677 is therefore inhibition of LOC144866 (Accession XM\_096699). Accordingly, utilities of VGAM1677 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144866. LOC149302 (Accession XM\_086489) is another VGAM1677 host target gene. LOC149302 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149302, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149302 BINDING SITE, designated SEQ ID:38706, to the nucleotide sequence of VGAM1677 RNA, herein designated VGAM RNA, also designated SEQ ID:4388.

[56673] Another function of VGAM1677 is therefore inhibition of LOC149302 (Accession XM\_086489). Accordingly, utilities of VGAM1677 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC149302. LOC149373 (Accession XM\_086507) is another VGAM1677 host target gene. LOC149373 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149373, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149373 BINDING SITE, designated SEQ ID:38719, to the nucleotide sequence of VGAM1677 RNA, herein designated VGAM RNA, also designated SEQ ID:4388.

[56674] Another function of VGAM1677 is therefore inhibition of LOC149373 (Accession XM\_086507). Accordingly, utilities of VGAM1677 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149373. LOC150685 (Accession XM\_103563) is another VGAM1677 host target gene. LOC150685 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC150685, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150685 BINDING SITE, designated SEQ ID:42155, to

the nucleotide sequence of VGAM1677 RNA, herein designated VGAM RNA, also designated SEQ ID:4388.

[56675] Another function of VGAM1677 is therefore inhibition of LOC150685 (Accession XM\_103563). Accordingly, utilities of VGAM1677 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150685. LOC152274 (Accession XM\_087418) is another VGAM1677 host target gene. LOC152274 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152274, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152274 BINDING SITE, designated SEQ ID:39235, to the nucleotide sequence of VGAM1677 RNA, herein designated VGAM RNA, also designated SEQ ID:4388.

[56676] Another function of VGAM1677 is therefore inhibition of LOC152274 (Accession XM\_087418). Accordingly, utilities of VGAM1677 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152274. LOC163682 (Accession XM\_099402) is another VGAM1677 host target gene. LOC163682 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC163682, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163682 BINDING SITE, designated SEQ ID:42089, to the nucleotide sequence of VGAM1677 RNA, herein designated VGAM RNA, also designated SEQ ID:4388.

[56677] Another function of VGAM1677 is therefore inhibition of LOC163682 (Accession XM\_099402). Accordingly, utilities of VGAM1677 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163682. LOC90906 (Accession XM\_034809) is another VGAM1677 host target gene. LOC90906 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90906, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90906 BINDING SITE, designated SEQ ID:32148, to the nucleotide sequence of VGAM1677 RNA, herein designated VGAM RNA, also designated SEQ ID:4388.

[56678] Another function of VGAM1677 is therefore inhibition of LOC90906 (Accession XM\_034809). Accordingly, utilities

of VGAM1677 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90906. LOC91445 (Accession XM\_018516) is another VGAM1677 host target gene. LOC91445 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91445, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91445 BINDING SITE, designated SEQ ID:30367, to the nucleotide sequence of VGAM1677 RNA, herein designated VGAM RNA, also designated SEQ ID:4388.

[56679] Another function of VGAM1677 is therefore inhibition of LOC91445 (Accession XM\_018516). Accordingly, utilities of VGAM1677 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91445. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1678 (VGAM1678) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[56680] VGAM1678 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1678 was detected is described hereinabove with reference to Figs. 1-8.

[56681] VGAM1678 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Viral Hemorrhagic Septicemia Virus. VGAM1678 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[56682] VGAM1678 gene encodes a VGAM1678 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1678 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1678 precursor RNA is designated SEQ ID:1664, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1664 is located at position 10783 relative to the genome of Viral Hemorrhagic Septicemia Virus.

[56683] VGAM1678 precursor RNA folds onto itself, forming VGAM1678 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[56684] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1678 folded precursor RNA into VGAM1678 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of VGAM1678 RNA is designated SEQ ID:4389, and is provided hereinbelow with reference to the sequence listing part.

[56685] VGAM1678 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1678 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1678 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[56686] VGAM1678 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1678 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1678 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1678 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1678 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[56687] The complementary binding of VGAM1678 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1678 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1678 host target RNA into VGAM1678 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[56688] It is appreciated that VGAM1678 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1678 host target genes. The mRNA of each one of this plurality of VGAM1678 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1678 RNA, herein designated VGAM RNA, and which when bound by VGAM1678 RNA causes inhibition of translation of respective one or more VGAM1678 host target proteins.

[56689] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1678 gene, herein designated VGAM GENE, on one or more VGAM1678 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[56690] It is yet further appreciated that a function of VGAM1678 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1678 include diagnosis, prevention and treatment of viral infection by Viral Hemorrhagic Septicemia Virus. Specific functions, and accordingly utilities, of VGAM1678 correlate with, and may be deduced from, the identity of the host target genes which VGAM1678 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[56691] Nucleotide sequences of the VGAM1678 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the  
`diced` VGAM1678 RNA, herein designated VGAM RNA,  
and a schematic representation of the secondary folding  
of VGAM1678 folded precursor RNA, herein designated  
VGAM FOLDED PRECURSOR RNA, of VGAM1678 are further  
described hereinbelow with reference to Table 1.

[56692] Nucleotide sequences of host target binding sites, such as  
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of  
Fig. 1, found on VGAM1678 host target RNA, and  
schematic representation of the complementarity of each  
of these host target binding sites to VGAM1678 RNA,  
herein designated VGAM RNA, are described hereinbelow  
with reference to Table 2.

[56693] As mentioned hereinabove with reference to Fig. 1, a  
function of VGAM1678 gene, herein designated VGAM is  
inhibition of expression of VGAM1678 target genes. It is  
appreciated that specific functions, and accordingly utili-  
ties, of VGAM1678 correlate with, and may be deduced  
from, the identity of the target genes which VGAM1678  
binds and inhibits, and the function of these target genes,  
as elaborated hereinbelow.

[56694] Phospholipase A2, Group IVC (cytosolic, calcium-in-  
dependent) (PLA2G4C, Accession XM\_055864) is a

VGAM1678 host target gene. PLA2G4C BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PLA2G4C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLA2G4C BINDING SITE, designated SEQ ID:36342, to the nucleotide sequence of VGAM1678 RNA, herein designated VGAM RNA, also designated SEQ ID:4389.

[56695] A function of VGAM1678 is therefore inhibition of Phospholipase A2, Group IVC (cytosolic, calcium-independent) (PLA2G4C, Accession XM\_055864), a gene which hydrolyzes the phospholipid sn-2 ester bond. Accordingly, utilities of VGAM1678 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLA2G4C. The function of PLA2G4C has been established by previous studies. The cytosolic phospholipases A2 (OMIM Ref. No. cPLA2s) catalyze the release of certain fatty acids from phospholipids and play a role in a wide range of physiologic functions. By searching an EST database to identify sequences similar to cPLA2-alpha (OMIM Ref. No. 600522), Underwood et al. (1998) identified a novel PLA2 homolog, which they named

cPLA2-gamma. They cloned the corresponding cDNA from a human skeletal muscle library. The cPLA2-gamma sequence predicts a 541-amino acid polypeptide with 28% identity to cPLA2-alpha. Expression studies showed that cPLA2-gamma liberates arachidonate from phospholipid, cleaving at either sn-1 or sn-2 sites. cPLA2-gamma is prenylated, membrane-associated, and calcium-independent. Northern blot analysis revealed that cPLA2-gamma is expressed as a 3-kb mRNA most abundantly in skeletal muscle and heart, with lower levels in several other tissues. Using STS analysis, Pickard et al. (1999) mapped the PLA2G4C gene to chromosome 19.

[56696] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[56697] Pickard, R. T.; Strifler, B. A.; Kramer, R. M.; Sharp, J. D. : Molecular cloning of two new human paralogs of 85-kDa cytosolic phospholipase A2. J. Biol. Chem. 274: 8823-8831, 1999. ; and

[56698] Underwood, K. W.; Song, C.; Kriz, R. W.; Chang, X. J.; Knopf, J. L.; Lin, L.-L. : A novel calcium-independent phospholipase A(2), cPLA(2)-gamma, that is prenylated and contains homolog.

[56699] Further studies establishing the function and utilities of PLA2G4C are found in John Hopkins OMIM database record ID 603602, and in cited publications numbered 4893 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Sel-1 Suppressor of Lin-12-like (C. elegans) (SEL1L, Accession NM\_005065) is another VGAM1678 host target gene. SEL1L BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEL1L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEL1L BINDING SITE, designated SEQ ID:11503, to the nucleotide sequence of VGAM1678 RNA, herein designated VGAM RNA, also designated SEQ ID:4389.

[56700] Another function of VGAM1678 is therefore inhibition of Sel-1 Suppressor of Lin-12-like (C. elegans) (SEL1L, Accession NM\_005065), a gene which may play a role in notch signaling (by similarity). Accordingly, utilities of VGAM1678 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEL1L. The function of SEL1L and its association with various diseases and clinical conditions, has been established by

previous studies, as described hereinabove with reference to VGAM245. Baculoviral IAP Repeat-containing 8 (BIRC8, Accession NM\_033341) is another VGAM1678 host target gene. BIRC8 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by BIRC8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BIRC8 BINDING SITE, designated SEQ ID:27194, to the nucleotide sequence of VGAM1678 RNA, herein designated VGAM RNA, also designated SEQ ID:4389.

[56701] Another function of VGAM1678 is therefore inhibition of Baculoviral IAP Repeat-containing 8 (BIRC8, Accession NM\_033341). Accordingly, utilities of VGAM1678 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BIRC8. C1q and Tumor Necrosis Factor Related Protein 7 (C1QTNF7, Accession NM\_031911) is another VGAM1678 host target gene. C1QTNF7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C1QTNF7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of C1QTNF7 BINDING SITE, designated SEQ ID:25666, to the nucleotide sequence of VGAM1678 RNA, herein designated VGAM RNA, also designated SEQ ID:4389.

[56702] Another function of VGAM1678 is therefore inhibition of C1q and Tumor Necrosis Factor Related Protein 7 (C1QTNF7, Accession NM\_031911). Accordingly, utilities of VGAM1678 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1QTNF7. DKFZp547I224 (Accession NM\_020221) is another VGAM1678 host target gene. DKFZp547I224 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp547I224, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547I224 BINDING SITE, designated SEQ ID:21478, to the nucleotide sequence of VGAM1678 RNA, herein designated VGAM RNA, also designated SEQ ID:4389.

[56703] Another function of VGAM1678 is therefore inhibition of DKFZp547I224 (Accession NM\_020221). Accordingly, utilities of VGAM1678 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with DKFZp547I224. FLJ10120 (Accession NM\_018001) is another VGAM1678 host target gene. FLJ10120 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10120, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10120 BINDING SITE, designated SEQ ID:19729, to the nucleotide sequence of VGAM1678 RNA, herein designated VGAM RNA, also designated SEQ ID:4389.

[56704] Another function of VGAM1678 is therefore inhibition of FLJ10120 (Accession NM\_018001). Accordingly, utilities of VGAM1678 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10120. FLJ11783 (Accession NM\_024891) is another VGAM1678 host target gene. FLJ11783 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11783, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11783 BINDING SITE, designated SEQ ID:24365, to the nucleotide

sequence of VGAM1678 RNA, herein designated VGAM RNA, also designated SEQ ID:4389.

[56705] Another function of VGAM1678 is therefore inhibition of FLJ11783 (Accession NM\_024891). Accordingly, utilities of VGAM1678 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11783. FLJ22174 (Accession NM\_021945) is another VGAM1678 host target gene. FLJ22174 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ22174, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22174 BINDING SITE, designated SEQ ID:22467, to the nucleotide sequence of VGAM1678 RNA, herein designated VGAM RNA, also designated SEQ ID:4389.

[56706] Another function of VGAM1678 is therefore inhibition of FLJ22174 (Accession NM\_021945). Accordingly, utilities of VGAM1678 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22174. FLJ23499 (Accession NM\_022761) is another VGAM1678 host target gene. FLJ23499 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by FLJ23499, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23499 BINDING SITE, designated SEQ ID:23005, to the nucleotide sequence of VGAM1678 RNA, herein designated VGAM RNA, also designated SEQ ID:4389.

[56707] Another function of VGAM1678 is therefore inhibition of FLJ23499 (Accession NM\_022761). Accordingly, utilities of VGAM1678 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23499. IKKE (Accession NM\_014002) is another VGAM1678 host target gene. IKKE BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by IKKE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IKKE BINDING SITE, designated SEQ ID:15203, to the nucleotide sequence of VGAM1678 RNA, herein designated VGAM RNA, also designated SEQ ID:4389.

[56708] Another function of VGAM1678 is therefore inhibition of IKKE (Accession NM\_014002). Accordingly, utilities of

VGAM1678 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IKKE. KIAA0323 (Accession XM\_032634) is another VGAM1678 host target gene. KIAA0323 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0323, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0323 BINDING SITE, designated SEQ ID:31695, to the nucleotide sequence of VGAM1678 RNA, herein designated VGAM RNA, also designated SEQ ID:4389.

[56709] Another function of VGAM1678 is therefore inhibition of KIAA0323 (Accession XM\_032634). Accordingly, utilities of VGAM1678 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0323. KIAA1161 (Accession XM\_088501) is another VGAM1678 host target gene. KIAA1161 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1161, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1161 BINDING SITE, designated SEQ ID:39754, to the nucleotide sequence of VGAM1678 RNA, herein designated VGAM RNA, also designated SEQ ID:4389.

[56710] Another function of VGAM1678 is therefore inhibition of KIAA1161 (Accession XM\_088501). Accordingly, utilities of VGAM1678 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1161. KIAA1727 (Accession XM\_034262) is another VGAM1678 host target gene. KIAA1727 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1727, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1727 BINDING SITE, designated SEQ ID:32033, to the nucleotide sequence of VGAM1678 RNA, herein designated VGAM RNA, also designated SEQ ID:4389.

[56711] Another function of VGAM1678 is therefore inhibition of KIAA1727 (Accession XM\_034262). Accordingly, utilities of VGAM1678 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1727. MGC4415 (Accession NM\_031484) is another VGAM1678 host target gene. MGC4415 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4415, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4415 BINDING SITE, designated SEQ ID:25570, to the nucleotide sequence of VGAM1678 RNA, herein designated VGAM RNA, also designated SEQ ID:4389.

[56712] Another function of VGAM1678 is therefore inhibition of MGC4415 (Accession NM\_031484). Accordingly, utilities of VGAM1678 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4415. Netrin 4 (NTN4, Accession XM\_031896) is another VGAM1678 host target gene. NTN4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NTN4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NTN4 BINDING SITE, designated SEQ ID:31513, to the nucleotide sequence of VGAM1678 RNA, herein designated VGAM RNA, also designated SEQ ID:4389.

[56713] Another function of VGAM1678 is therefore inhibition of

Netrin 4 (NTN4, Accession XM\_031896). Accordingly, utilities of VGAM1678 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NTN4. RNA-binding Region (RNP1, RRM) Containing 1 (RNPC1, Accession NM\_017495) is another VGAM1678 host target gene. RNPC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNPC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNPC1 BINDING SITE, designated SEQ ID:18958, to the nucleotide sequence of VGAM1678 RNA, herein designated VGAM RNA, also designated SEQ ID:4389.

[56714] Another function of VGAM1678 is therefore inhibition of RNA-binding Region (RNP1, RRM) Containing 1 (RNPC1, Accession NM\_017495). Accordingly, utilities of VGAM1678 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNPC1. Synovial Sarcoma Translocation Gene On Chromosome 18-like 1 (SS18L1, Accession XM\_037202) is another VGAM1678 host target gene. SS18L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by SS18L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SS18L1 BINDING SITE, designated SEQ ID:32562, to the nucleotide sequence of VGAM1678 RNA, herein designated VGAM RNA, also designated SEQ ID:4389.

[56715] Another function of VGAM1678 is therefore inhibition of Synovial Sarcoma Translocation Gene On Chromosome 18-like 1 (SS18L1, Accession XM\_037202). Accordingly, utilities of VGAM1678 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SS18L1. LOC114932 (Accession XM\_052614) is another VGAM1678 host target gene. LOC114932 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC114932, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC114932 BINDING SITE, designated SEQ ID:36005, to the nucleotide sequence of VGAM1678 RNA, herein designated VGAM RNA, also designated SEQ ID:4389.

[56716] Another function of VGAM1678 is therefore inhibition of

LOC114932 (Accession XM\_052614). Accordingly, utilities of VGAM1678 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC114932. LOC145497 (Accession XM\_085150) is another VGAM1678 host target gene. LOC145497 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145497, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145497 BINDING SITE, designated SEQ ID:37871, to the nucleotide sequence of VGAM1678 RNA, herein designated VGAM RNA, also designated SEQ ID:4389.

[56717] Another function of VGAM1678 is therefore inhibition of LOC145497 (Accession XM\_085150). Accordingly, utilities of VGAM1678 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145497. LOC145978 (Accession XM\_085288) is another VGAM1678 host target gene. LOC145978 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145978, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC145978 BINDING SITE, designated SEQ ID:38033, to the nucleotide sequence of VGAM1678 RNA, herein designated VGAM RNA, also designated SEQ ID:4389.

[56718] Another function of VGAM1678 is therefore inhibition of LOC145978 (Accession XM\_085288). Accordingly, utilities of VGAM1678 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145978. LOC146429 (Accession XM\_096998) is another VGAM1678 host target gene. LOC146429 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146429, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146429 BINDING SITE, designated SEQ ID:40696, to the nucleotide sequence of VGAM1678 RNA, herein designated VGAM RNA, also designated SEQ ID:4389.

[56719] Another function of VGAM1678 is therefore inhibition of LOC146429 (Accession XM\_096998). Accordingly, utilities of VGAM1678 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146429. LOC149386 (Accession XM\_097631) is an-

other VGAM1678 host target gene. LOC149386 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149386, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149386 BINDING SITE, designated SEQ ID:40987, to the nucleotide sequence of VGAM1678 RNA, herein designated VGAM RNA, also designated SEQ ID:4389.

[56720] Another function of VGAM1678 is therefore inhibition of LOC149386 (Accession XM\_097631). Accordingly, utilities of VGAM1678 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149386. LOC158581 (Accession XM\_098968) is another VGAM1678 host target gene. LOC158581 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158581, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158581 BINDING SITE, designated SEQ ID:42015, to the nucleotide sequence of VGAM1678 RNA, herein designated VGAM RNA, also designated SEQ ID:4389.

[56721] Another function of VGAM1678 is therefore inhibition of LOC158581 (Accession XM\_098968). Accordingly, utilities of VGAM1678 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158581. LOC202460 (Accession XM\_114493) is another VGAM1678 host target gene. LOC202460 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC202460, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202460 BINDING SITE, designated SEQ ID:42984, to the nucleotide sequence of VGAM1678 RNA, herein designated VGAM RNA, also designated SEQ ID:4389.

[56722] Another function of VGAM1678 is therefore inhibition of LOC202460 (Accession XM\_114493). Accordingly, utilities of VGAM1678 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202460. LOC219894 (Accession XM\_167782) is another VGAM1678 host target gene. LOC219894 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219894, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219894 BINDING SITE, designated SEQ ID:44792, to the nucleotide sequence of VGAM1678 RNA, herein designated VGAM RNA, also designated SEQ ID:4389.

[56723] Another function of VGAM1678 is therefore inhibition of LOC219894 (Accession XM\_167782). Accordingly, utilities of VGAM1678 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219894. LOC221751 (Accession XM\_166370) is another VGAM1678 host target gene. LOC221751 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221751, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221751 BINDING SITE, designated SEQ ID:44190, to the nucleotide sequence of VGAM1678 RNA, herein designated VGAM RNA, also designated SEQ ID:4389.

[56724] Another function of VGAM1678 is therefore inhibition of LOC221751 (Accession XM\_166370). Accordingly, utilities of VGAM1678 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC221751. LOC254268 (Accession XM\_170913) is another VGAM1678 host target gene. LOC254268 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254268, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254268 BINDING SITE, designated SEQ ID:45691, to the nucleotide sequence of VGAM1678 RNA, herein designated VGAM RNA, also designated SEQ ID:4389.

[56725] Another function of VGAM1678 is therefore inhibition of LOC254268 (Accession XM\_170913). Accordingly, utilities of VGAM1678 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254268. LOC255252 (Accession XM\_170779) is another VGAM1678 host target gene. LOC255252 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255252, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255252 BINDING SITE, designated SEQ ID:45546, to the nucleotide sequence of VGAM1678 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4389.

[56726] Another function of VGAM1678 is therefore inhibition of LOC255252 (Accession XM\_170779). Accordingly, utilities of VGAM1678 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255252. LOC90499 (Accession XM\_032170) is another VGAM1678 host target gene. LOC90499 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90499, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90499 BINDING SITE, designated SEQ ID:31581, to the nucleotide sequence of VGAM1678 RNA, herein designated VGAM RNA, also designated SEQ ID:4389.

[56727] Another function of VGAM1678 is therefore inhibition of LOC90499 (Accession XM\_032170). Accordingly, utilities of VGAM1678 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90499. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1679 (VGAM1679) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[56728] VGAM1679 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1679 was detected is described hereinabove with reference to Figs. 1–8.

[56729] VGAM1679 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Viral Hemorrhagic Septicemia Virus. VGAM1679 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[56730] VGAM1679 gene encodes a VGAM1679 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1679 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1679 precursor RNA is designated SEQ ID:1665, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1665 is located at position 1372 relative to the genome of Viral Hemorrhagic Septicemia Virus.

[56731] VGAM1679 precursor RNA folds onto itself, forming

VGAM1679 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[56732] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1679 folded precursor RNA into VGAM1679 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1679 RNA is designated SEQ ID:4390, and is provided hereinbelow with reference to the sequence listing part.

[56733] VGAM1679 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1679 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1679 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[56734] VGAM1679 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1679 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1679 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1679 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1679 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[56735] The complementary binding of VGAM1679 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1679 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1679 host target RNA into VGAM1679 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[56736] It is appreciated that VGAM1679 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1679 host target genes. The mRNA of each one of this plurality of VGAM1679 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1679 RNA, herein designated VGAM RNA, and which when bound by VGAM1679 RNA causes inhibition of translation of respective one or more VGAM1679 host target proteins.

[56737] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1679 gene, herein designated VGAM GENE, on one or more VGAM1679 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[56738] It is yet further appreciated that a function of VGAM1679 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1679 include diagnosis, prevention and treatment of viral infection by Viral Hemorrhagic Septicemia Virus. Specific functions, and accordingly utilities, of VGAM1679 correlate with, and may be deduced from, the identity of the host target genes which VGAM1679

binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[56739] Nucleotide sequences of the VGAM1679 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1679 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1679 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1679 are further described hereinbelow with reference to Table 1.

[56740] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1679 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1679 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[56741] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1679 gene, herein designated VGAM is inhibition of expression of VGAM1679 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1679 correlate with, and may be deduced from, the identity of the target genes which VGAM1679 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[56742] Cyclin-dependent Kinase 5, Regulatory Subunit 2 (p39) (CDK5R2, Accession NM\_003936) is a VGAM1679 host target gene. CDK5R2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDK5R2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDK5R2 BINDING SITE, designated SEQ ID:10042, to the nucleotide sequence of VGAM1679 RNA, herein designated VGAM RNA, also designated SEQ ID:4390.

[56743] A function of VGAM1679 is therefore inhibition of Cyclin-dependent Kinase 5, Regulatory Subunit 2 (p39) (CDK5R2, Accession NM\_003936), a gene which acts as a regulatory subunit for the cyclin-dependent CDK5. Accordingly, utilities of VGAM1679 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDK5R2. The function of CDK5R2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM403. Paired Basic Amino Acid Cleaving System 4 (PACE4, Accession NM\_138319) is an-

other VGAM1679 host target gene. PACE4 BINDING SITE1 and PACE4 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PACE4, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PACE4 BINDING SITE1 and PACE4 BINDING SITE2, designated SEQ ID:28720 and SEQ ID:8431 respectively, to the nucleotide sequence of VGAM1679 RNA, herein designated VGAM RNA, also designated SEQ ID:4390.

[56744] Another function of VGAM1679 is therefore inhibition of Paired Basic Amino Acid Cleaving System 4 (PACE4, Accession NM\_138319), a gene which processes hormone precursors by cleaving paired basic amino acids. Accordingly, utilities of VGAM1679 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PACE4. The function of PACE4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1194.ARL8 (Accession XM\_167671) is another VGAM1679 host target gene. ARL8 BINDING SITE is HOST TARGET binding site found in the

3` untranslated region of mRNA encoded by ARL8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARL8 BINDING SITE, designated SEQ ID:44763, to the nucleotide sequence of VGAM1679 RNA, herein designated VGAM RNA, also designated SEQ ID:4390.

[56745] Another function of VGAM1679 is therefore inhibition of ARL8 (Accession XM\_167671). Accordingly, utilities of VGAM1679 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARL8. FLJ13659 (Accession NM\_025189) is another VGAM1679 host target gene. FLJ13659 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13659, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13659 BINDING SITE, designated SEQ ID:24830, to the nucleotide sequence of VGAM1679 RNA, herein designated VGAM RNA, also designated SEQ ID:4390.

[56746] Another function of VGAM1679 is therefore inhibition of FLJ13659 (Accession NM\_025189). Accordingly, utilities of

VGAM1679 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13659. Guanine Nucleotide Binding Protein (G protein), Gamma 4 (GNG4, Accession NM\_004485) is another VGAM1679 host target gene. GNG4 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GNG4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNG4 BINDING SITE, designated SEQ ID:10811, to the nucleotide sequence of VGAM1679 RNA, herein designated VGAM RNA, also designated SEQ ID:4390.

[56747] Another function of VGAM1679 is therefore inhibition of Guanine Nucleotide Binding Protein (G protein), Gamma 4 (GNG4, Accession NM\_004485). Accordingly, utilities of VGAM1679 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNG4. HTCD37 (Accession XM\_041884) is another VGAM1679 host target gene. HTCD37 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HTCD37, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HTCD37 BINDING SITE, designated SEQ ID:33620, to the nucleotide sequence of VGAM1679 RNA, herein designated VGAM RNA, also designated SEQ ID:4390.

[56748] Another function of VGAM1679 is therefore inhibition of HTCD37 (Accession XM\_041884). Accordingly, utilities of VGAM1679 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTCD37. KIAA0451 (Accession NM\_014826) is another VGAM1679 host target gene. KIAA0451 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0451, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0451 BINDING SITE, designated SEQ ID:16803, to the nucleotide sequence of VGAM1679 RNA, herein designated VGAM RNA, also designated SEQ ID:4390.

[56749] Another function of VGAM1679 is therefore inhibition of KIAA0451 (Accession NM\_014826). Accordingly, utilities of VGAM1679 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0451. MGC2562 (Accession NM\_032374) is another VGAM1679 host target gene. MGC2562 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC2562, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2562 BINDING SITE, designated SEQ ID:26163, to the nucleotide sequence of VGAM1679 RNA, herein designated VGAM RNA, also designated SEQ ID:4390.

[56750] Another function of VGAM1679 is therefore inhibition of MGC2562 (Accession NM\_032374). Accordingly, utilities of VGAM1679 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2562. Transducer of ERBB2, 2 (TOB2, Accession XM\_170995) is another VGAM1679 host target gene. TOB2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TOB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TOB2 BINDING SITE, designated SEQ ID:45770, to the nucleotide sequence of VGAM1679 RNA, herein

designated VGAM RNA, also designated SEQ ID:4390.

[56751] Another function of VGAM1679 is therefore inhibition of Transducer of ERBB2, 2 (TOB2, Accession XM\_170995). Accordingly, utilities of VGAM1679 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOB2. LOC149576 (Accession XM\_086580) is another VGAM1679 host target gene. LOC149576 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149576, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149576 BINDING SITE, designated SEQ ID:38775, to the nucleotide sequence of VGAM1679 RNA, herein designated VGAM RNA, also designated SEQ ID:4390.

[56752] Another function of VGAM1679 is therefore inhibition of LOC149576 (Accession XM\_086580). Accordingly, utilities of VGAM1679 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149576. LOC151278 (Accession XM\_087156) is another VGAM1679 host target gene. LOC151278 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC151278, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151278 BINDING SITE, designated SEQ ID:39097, to the nucleotide sequence of VGAM1679 RNA, herein designated VGAM RNA, also designated SEQ ID:4390.

[56753] Another function of VGAM1679 is therefore inhibition of LOC151278 (Accession XM\_087156). Accordingly, utilities of VGAM1679 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151278. LOC91565 (Accession XM\_039231) is another VGAM1679 host target gene. LOC91565 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91565, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91565 BINDING SITE, designated SEQ ID:33024, to the nucleotide sequence of VGAM1679 RNA, herein designated VGAM RNA, also designated SEQ ID:4390.

[56754] Another function of VGAM1679 is therefore inhibition of LOC91565 (Accession XM\_039231). Accordingly, utilities

of VGAM1679 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91565. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1680 (VGAM1680) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[56755] VGAM1680 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1680 was detected is described hereinabove with reference to Figs. 1-8.

[56756] VGAM1680 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Viral Hemorrhagic Septicemia Virus. VGAM1680 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[56757] VGAM1680 gene encodes a VGAM1680 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1680 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM1680 precursor RNA is designated SEQ ID:1666, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1666 is located at position 10244 relative to the genome of Viral Hemorrhagic Septicemia Virus.

[56758] VGAM1680 precursor RNA folds onto itself, forming VGAM1680 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[56759] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1680 folded precursor RNA into VGAM1680 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1680 RNA is designated SEQ ID:4391, and

is provided hereinbelow with reference to the sequence listing part.

[56760] VGAM1680 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1680 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1680 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[56761] VGAM1680 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1680 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1680 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM1680 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1680 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[56762] The complementary binding of VGAM1680 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1680 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1680 host target RNA into VGAM1680 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[56763] It is appreciated that VGAM1680 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1680 host target genes. The mRNA of each one of this plurality of VGAM1680 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com–

plementary to VGAM1680 RNA, herein designated VGAM RNA, and which when bound by VGAM1680 RNA causes inhibition of translation of respective one or more VGAM1680 host target proteins.

[56764] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1680 gene, herein designated VGAM GENE, on one or more VGAM1680 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[56765] It is yet further appreciated that a function of VGAM1680 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1680 include diagnosis, prevention and treatment of viral infection by Viral Hemorrhagic Septicemia Virus. Specific functions, and accordingly utilities, of VGAM1680 correlate with, and may be deduced from, the identity of the host target genes which VGAM1680 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[56766] Nucleotide sequences of the VGAM1680 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1680 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1680 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1680 are further described hereinbelow with reference to Table 1.

[56767] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1680 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1680 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[56768] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM1680 gene, herein designated VGAM is inhibition of expression of VGAM1680 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1680 correlate with, and may be deduced from, the identity of the target genes which VGAM1680 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[56769] Collagen, Type XIII, Alpha 1 (COL13A1, Accession NM\_080799) is a VGAM1680 host target gene. COL13A1 BINDING SITE1 through COL13A1 BINDING SITE7 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by COL13A1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL13A1 BINDING SITE1 through COL13A1 BINDING SITE7, designated SEQ ID:28066, SEQ ID:28068, SEQ ID:28070, SEQ ID:28072, SEQ ID:28074, SEQ ID:28076 and SEQ ID:11703 respectively, to the nucleotide sequence of VGAM1680 RNA, herein designated VGAM RNA, also designated SEQ ID:4391.

[56770] A function of VGAM1680 is therefore inhibition of Collagen, Type XIII, Alpha 1 (COL13A1, Accession NM\_080799),

a gene which is specific for basement membranes. Accordingly, utilities of VGAM1680 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL13A1. The function of COL13A1 has been established by previous studies. Tikka et al. (1988) isolated and partially characterized the gene for the alpha-1 chain of type XIII collagen. Some of the features resembled those of genes for fibrillar collagens, but other features were distinctly different. Analysis of overlapping cDNA clones and nuclease S1 mapping of mRNAs indicated 1 alternative splicing site causing a deletion of 36 bp from the mature mRNA. The 36 bp represented a single exon. Furthermore, a 45-bp exon was also subject to alternative splicing. Of the 3 major groups of collagens--the fibrillar collagens, the large nonfibrillar collagens, and the short-chain collagens--type XIII collagen belongs to the third group. Shows et al. (1989) mapped the COL13A1 gene to 10q22 by a combination of somatic cell hybrid study and in situ hybridization. Pajunen et al. (1989) assigned the COL13A1 gene to 10q11-qter by Southern blot hybridization of DNA from human/rodent somatic cell hybrids. The gene for type XIII collagen (COL13A1) and that for the alpha-1 subunit of prolyl

4-hydroxylase (P4HA1; 176710) had been assigned to 10q22 and 10q21.3–q23.1 by isotopic in situ hybridization. Horelli-Kuitunen et al. (1997) applied fluorescence in situ hybridization (FISH) combined with targets representing different levels of resolution to determine the order of these genes along chromosome 10, their transcriptional orientation, and the distance between them. Using mechanically stretched chromosomes they determined the order to be cen–COL13A1–P4HA1–tel. By combining the data from stretched chromosomes and interphase nuclei, they found that the transcriptional orientation was tail-to-tail. The distance between the genes was measured by fiber FISH to be approximately 550 kb.

[56771] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[56773] Horelli-Kuitunen, N.; Kvist, A.-P.; Helaakoski, T.; Kivirikko,

K.; Pihlajaniemi, T.; Palotie, A. : The order and transcriptional orientation of the human COL13A1 and P4HA genes on chrom.

[56774] Further studies establishing the function and utilities of COL13A1 are found in John Hopkins OMIM database record ID 120350, and in cited publications numbered 12045–12048 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Hippocalcin-like 1 (HPCAL1, Accession NM\_002149) is another VGAM1680 host target gene. HPCAL1 BINDING SITE1 and HPCAL1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by HPCAL1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HPCAL1 BINDING SITE1 and HPCAL1 BINDING SITE2, designated SEQ ID:7931 and SEQ ID:36465 respectively, to the nucleotide sequence of VGAM1680 RNA, herein designated VGAM RNA, also designated SEQ ID:4391.

[56775] Another function of VGAM1680 is therefore inhibition of Hippocalcin-like 1 (HPCAL1, Accession NM\_002149). Accordingly, utilities of VGAM1680 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with HPCAL1. KIAA1910 (Accession XM\_055514) is another VGAM1680 host target gene. KIAA1910 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1910, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1910 BINDING SITE, designated SEQ ID:36285, to the nucleotide sequence of VGAM1680 RNA, herein designated VGAM RNA, also designated SEQ ID:4391.

[56776] Another function of VGAM1680 is therefore inhibition of KIAA1910 (Accession XM\_055514). Accordingly, utilities of VGAM1680 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1910. MGC10818 (Accession NM\_030568) is another VGAM1680 host target gene. MGC10818 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC10818, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

MGC10818 BINDING SITE, designated SEQ ID:24940, to the nucleotide sequence of VGAM1680 RNA, herein designated VGAM RNA, also designated SEQ ID:4391.

[56777] Another function of VGAM1680 is therefore inhibition of MGC10818 (Accession NM\_030568). Accordingly, utilities of VGAM1680 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10818. RAB40C, Member RAS Oncogene Family (RAB40C, Accession NM\_021168) is another VGAM1680 host target gene. RAB40C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB40C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB40C BINDING SITE, designated SEQ ID:22145, to the nucleotide sequence of VGAM1680 RNA, herein designated VGAM RNA, also designated SEQ ID:4391.

[56778] Another function of VGAM1680 is therefore inhibition of RAB40C, Member RAS Oncogene Family (RAB40C, Accession NM\_021168). Accordingly, utilities of VGAM1680 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB40C. SCAMP-4

(Accession NM\_079834) is another VGAM1680 host target gene. SCAMP-4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCAMP-4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCAMP-4 BINDING SITE, designated SEQ ID:27822, to the nucleotide sequence of VGAM1680 RNA, herein designated VGAM RNA, also designated SEQ ID:4391.

[56779] Another function of VGAM1680 is therefore inhibition of SCAMP-4 (Accession NM\_079834). Accordingly, utilities of VGAM1680 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCAMP-4. LOC221288 (Accession XM\_168058) is another VGAM1680 host target gene. LOC221288 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221288, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221288 BINDING SITE, designated SEQ ID:44969, to the nucleotide sequence of VGAM1680 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4391.

[56780] Another function of VGAM1680 is therefore inhibition of LOC221288 (Accession XM\_168058). Accordingly, utilities of VGAM1680 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221288. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1681 (VGAM1681) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[56781] VGAM1681 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1681 was detected is described hereinabove with reference to Figs. 1–8.

[56782] VGAM1681 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vesicular Stomatitis Indiana Virus. VGAM1681 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[56783] VGAM1681 gene encodes a VGAM1681 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM1681 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1681 precursor RNA is designated SEQ ID:1667, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1667 is located at position 3549 relative to the genome of Vesicular Stomatitis Indiana Virus.

[56784] VGAM1681 precursor RNA folds onto itself, forming VGAM1681 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[56785] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1681 folded precursor RNA into VGAM1681 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1681 RNA is designated SEQ ID:4392, and is provided hereinbelow with reference to the sequence listing part.

[56786] VGAM1681 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1681 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1681 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[56787] VGAM1681 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1681 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1681 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1681 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1681 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[56788] The complementary binding of VGAM1681 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1681 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1681 host target RNA into VGAM1681 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[56789] It is appreciated that VGAM1681 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1681 host target genes. The mRNA of

each one of this plurality of VGAM1681 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1681 RNA, herein designated VGAM RNA, and which when bound by VGAM1681 RNA causes inhibition of translation of respective one or more VGAM1681 host target proteins.

[56790] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1681 gene, herein designated VGAM GENE, on one or more VGAM1681 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[56791] It is yet further appreciated that a function of VGAM1681 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1681 include diagnosis, prevention and treatment of viral infection by Vesicular Stomatitis Indiana Virus. Specific functions, and accordingly utilities, of VGAM1681 correlate with, and may be deduced from, the identity of the host target genes which VGAM1681 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[56792] Nucleotide sequences of the VGAM1681 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1681 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1681 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1681 are further described hereinbelow with reference to Table 1.

[56793] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1681 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1681 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[56794] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1681 gene, herein designated VGAM is inhibition of expression of VGAM1681 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1681 correlate with, and may be deduced from, the identity of the target genes which VGAM1681 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[56795] Cystic Fibrosis Transmembrane Conductance Regulator, ATP-binding Cassette (sub-family C, member 7) (CFTR, Accession NM\_000492) is a VGAM1681 host target gene. CFTR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CFTR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CFTR BINDING SITE, designated SEQ ID:6103, to the nucleotide sequence of VGAM1681 RNA, herein designated VGAM RNA, also designated SEQ ID:4392.

[56796] A function of VGAM1681 is therefore inhibition of Cystic Fibrosis Transmembrane Conductance Regulator, ATP-

binding Cassette (sub-family C, member 7) (CFTR, Accession NM\_000492). Accordingly, utilities of VGAM1681 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CFTR. Steroid Sulfatase (microsomal), Arylsulfatase C, Isozyme S (STS, Accession NM\_000351) is another VGAM1681 host target gene. STS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STS BINDING SITE, designated SEQ ID:5911, to the nucleotide sequence of VGAM1681 RNA, herein designated VGAM RNA, also designated SEQ ID:4392.

[56797] Another function of VGAM1681 is therefore inhibition of Steroid Sulfatase (microsomal), Arylsulfatase C, Isozyme S (STS, Accession NM\_000351). Accordingly, utilities of VGAM1681 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STS. FLJ11286 (Accession NM\_018381) is another VGAM1681 host target gene. FLJ11286 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11286, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11286 BINDING SITE, designated SEQ ID:20414, to the nucleotide sequence of VGAM1681 RNA, herein designated VGAM RNA, also designated SEQ ID:4392.

[56798] Another function of VGAM1681 is therefore inhibition of FLJ11286 (Accession NM\_018381). Accordingly, utilities of VGAM1681 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11286. KIAA0747 (Accession NM\_015292) is another VGAM1681 host target gene. KIAA0747 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0747, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0747 BINDING SITE, designated SEQ ID:17612, to the nucleotide sequence of VGAM1681 RNA, herein designated VGAM RNA, also designated SEQ ID:4392.

[56799] Another function of VGAM1681 is therefore inhibition of KIAA0747 (Accession NM\_015292). Accordingly, utilities of VGAM1681 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA0747. MGC13061 (Accession NM\_032322) is another VGAM1681 host target gene. MGC13061 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC13061, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13061 BINDING SITE, designated SEQ ID:26132, to the nucleotide sequence of VGAM1681 RNA, herein designated VGAM RNA, also designated SEQ ID:4392.

[56800] Another function of VGAM1681 is therefore inhibition of MGC13061 (Accession NM\_032322). Accordingly, utilities of VGAM1681 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13061. Talin 2 (TLN2, Accession XM\_029473) is another VGAM1681 host target gene. TLN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TLN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TLN2 BINDING SITE, designated SEQ ID:30897, to the nucleotide se-

quence of VGAM1681 RNA, herein designated VGAM RNA, also designated SEQ ID:4392.

[56801] Another function of VGAM1681 is therefore inhibition of Talin 2 (TLN2, Accession XM\_029473). Accordingly, utilities of VGAM1681 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TLN2. LOC151361 (Accession XM\_098048) is another VGAM1681 host target gene. LOC151361 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151361, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151361 BINDING SITE, designated SEQ ID:41334, to the nucleotide sequence of VGAM1681 RNA, herein designated VGAM RNA, also designated SEQ ID:4392.

[56802] Another function of VGAM1681 is therefore inhibition of LOC151361 (Accession XM\_098048). Accordingly, utilities of VGAM1681 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151361. LOC158314 (Accession XM\_098920) is another VGAM1681 host target gene. LOC158314 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC158314, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158314 BINDING SITE, designated SEQ ID:41952, to the nucleotide sequence of VGAM1681 RNA, herein designated VGAM RNA, also designated SEQ ID:4392.

[56803] Another function of VGAM1681 is therefore inhibition of LOC158314 (Accession XM\_098920). Accordingly, utilities of VGAM1681 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158314. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1682 (VGAM1682) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[56804] VGAM1682 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1682 was detected is described hereinabove with reference to Figs. 1-8.

[56805] VGAM1682 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Vesicular Stomatitis Indiana Virus. VGAM1682 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[56806] VGAM1682 gene encodes a VGAM1682 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1682 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1682 precursor RNA is designated SEQ ID:1668, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1668 is located at position 10245 relative to the genome of Vesicular Stomatitis Indiana Virus.

[56807] VGAM1682 precursor RNA folds onto itself, forming VGAM1682 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[56808] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1682 folded precursor RNA into VGAM1682 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1682 RNA is designated SEQ ID:4393, and is provided hereinbelow with reference to the sequence listing part.

[56809] VGAM1682 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1682 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1682 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[56810] VGAM1682 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1682 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1682 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1682 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1682 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[56811] The complementary binding of VGAM1682 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1682 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1682

host target RNA into VGAM1682 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[56812] It is appreciated that VGAM1682 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1682 host target genes. The mRNA of each one of this plurality of VGAM1682 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1682 RNA, herein designated VGAM RNA, and which when bound by VGAM1682 RNA causes inhibition of translation of respective one or more VGAM1682 host target proteins.

[56813] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1682 gene, herein designated VGAM GENE, on one or more VGAM1682 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[56814] It is yet further appreciated that a function of VGAM1682 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1682 include diagnosis, prevention and treatment of viral infection by Vesicular Stomatitis Indiana Virus. Specific functions, and accordingly utilities, of VGAM1682 correlate with, and may be deduced from, the identity of the host target genes which VGAM1682 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[56815] Nucleotide sequences of the VGAM1682 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1682 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1682 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1682 are further

described hereinbelow with reference to Table 1.

[56816] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1682 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1682 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[56817] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1682 gene, herein designated VGAM is inhibition of expression of VGAM1682 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1682 correlate with, and may be deduced from, the identity of the target genes which VGAM1682 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[56818] UDP-Gal:betaGlcNAc Beta 1,3-galactosyltransferase, Polypeptide 3 (B3GALT3, Accession NM\_003781) is a VGAM1682 host target gene. B3GALT3 BINDING SITE1 through B3GALT3 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by B3GALT3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B3GALT3 BINDING SITE1 through B3GALT3 BINDING SITE3, designated SEQ ID:9867, SEQ ID:27016 and SEQ ID:27019 respectively, to the nucleotide sequence of VGAM1682 RNA, herein designated VGAM RNA, also designated SEQ ID:4393.

[56819] A function of VGAM1682 is therefore inhibition of UDP-Gal:betaGlcNAc Beta 1,3-galactosyltransferase, Polypeptide 3 (B3GALT3, Accession NM\_003781). Accordingly, utilities of VGAM1682 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B3GALT3. DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 28 (DDX28, Accession NM\_018380) is another VGAM1682 host target gene. DDX28 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DDX28, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDX28 BINDING SITE, designated SEQ ID:20406, to the nucleotide sequence of VGAM1682 RNA, herein designated VGAM RNA, also designated SEQ ID:4393.

[56820] Another function of VGAM1682 is therefore inhibition of

DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 28 (DDX28, Accession NM\_018380). Accordingly, utilities of VGAM1682 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX28. KIAA1323 (Accession XM\_032146) is another VGAM1682 host target gene. KIAA1323 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1323, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1323 BINDING SITE, designated SEQ ID:31572, to the nucleotide sequence of VGAM1682 RNA, herein designated VGAM RNA, also designated SEQ ID:4393.

[56821] Another function of VGAM1682 is therefore inhibition of KIAA1323 (Accession XM\_032146). Accordingly, utilities of VGAM1682 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1323. MGC5306 (Accession NM\_024116) is another VGAM1682 host target gene. MGC5306 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC5306, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC5306 BINDING SITE, designated SEQ ID:23570, to the nucleotide sequence of VGAM1682 RNA, herein designated VGAM RNA, also designated SEQ ID:4393.

[56822] Another function of VGAM1682 is therefore inhibition of MGC5306 (Accession NM\_024116). Accordingly, utilities of VGAM1682 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC5306. PRO1386 (Accession NM\_031269) is another VGAM1682 host target gene. PRO1386 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRO1386, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1386 BINDING SITE, designated SEQ ID:25292, to the nucleotide sequence of VGAM1682 RNA, herein designated VGAM RNA, also designated SEQ ID:4393.

[56823] Another function of VGAM1682 is therefore inhibition of PRO1386 (Accession NM\_031269). Accordingly, utilities of VGAM1682 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

PRO1386. Testis-specific Transcript, Y-linked 9 (TTY9, Accession NM\_031927) is another VGAM1682 host target gene. TTY9 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TTY9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TTY9 BINDING SITE, designated SEQ ID:25681, to the nucleotide sequence of VGAM1682 RNA, herein designated VGAM RNA, also designated SEQ ID:4393.

[56824] Another function of VGAM1682 is therefore inhibition of Testis-specific Transcript, Y-linked 9 (TTY9, Accession NM\_031927). Accordingly, utilities of VGAM1682 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TTY9. LOC143286 (Accession XM\_096412) is another VGAM1682 host target gene. LOC143286 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC143286, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143286 BINDING SITE, desig-

nated SEQ ID:40351, to the nucleotide sequence of VGAM1682 RNA, herein designated VGAM RNA, also designated SEQ ID:4393.

[56825] Another function of VGAM1682 is therefore inhibition of LOC143286 (Accession XM\_096412). Accordingly, utilities of VGAM1682 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143286. LOC150519 (Accession XM\_086937) is another VGAM1682 host target gene. LOC150519 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150519, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150519 BINDING SITE, designated SEQ ID:38989, to the nucleotide sequence of VGAM1682 RNA, herein designated VGAM RNA, also designated SEQ ID:4393.

[56826] Another function of VGAM1682 is therefore inhibition of LOC150519 (Accession XM\_086937). Accordingly, utilities of VGAM1682 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150519. LOC222128 (Accession XM\_166560) is another VGAM1682 host target gene. LOC222128 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC222128, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222128 BINDING SITE, designated SEQ ID:44543, to the nucleotide sequence of VGAM1682 RNA, herein designated VGAM RNA, also designated SEQ ID:4393.

[56827] Another function of VGAM1682 is therefore inhibition of LOC222128 (Accession XM\_166560). Accordingly, utilities of VGAM1682 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222128. LOC57795 (Accession XM\_045110) is another VGAM1682 host target gene. LOC57795 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC57795, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC57795 BINDING SITE, designated SEQ ID:34360, to the nucleotide sequence of VGAM1682 RNA, herein designated VGAM RNA, also designated SEQ ID:4393.

[56828] Another function of VGAM1682 is therefore inhibition of

LOC57795 (Accession XM\_045110). Accordingly, utilities of VGAM1682 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC57795. LOC85479 (Accession NM\_033105) is another VGAM1682 host target gene. LOC85479 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC85479, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC85479 BINDING SITE, designated SEQ ID:26959, to the nucleotide sequence of VGAM1682 RNA, herein designated VGAM RNA, also designated SEQ ID:4393.

[56829] Another function of VGAM1682 is therefore inhibition of LOC85479 (Accession NM\_033105). Accordingly, utilities of VGAM1682 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC85479. LOC92573 (Accession XM\_045884) is another VGAM1682 host target gene. LOC92573 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92573, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC92573 BINDING SITE, designated SEQ ID:34602, to the nucleotide sequence of VGAM1682 RNA, herein designated VGAM RNA, also designated SEQ ID:4393.

[56830] Another function of VGAM1682 is therefore inhibition of LOC92573 (Accession XM\_045884). Accordingly, utilities of VGAM1682 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92573. LOC92973 (Accession XM\_048529) is another VGAM1682 host target gene. LOC92973 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92973, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92973 BINDING SITE, designated SEQ ID:35182, to the nucleotide sequence of VGAM1682 RNA, herein designated VGAM RNA, also designated SEQ ID:4393.

[56831] Another function of VGAM1682 is therefore inhibition of LOC92973 (Accession XM\_048529). Accordingly, utilities of VGAM1682 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92973. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1683 (VGAM1683) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[56832] VGAM1683 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1683 was detected is described hereinabove with reference to Figs. 1–8.

[56833] VGAM1683 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vesicular Stomatitis Indiana Virus. VGAM1683 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[56834] VGAM1683 gene encodes a VGAM1683 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1683 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1683 precursor RNA is designated SEQ ID:1669, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:1669 is located at position 8817 relative to the genome of Vesicular Stomatitis Indiana Virus.

[56835] VGAM1683 precursor RNA folds onto itself, forming VGAM1683 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[56836] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1683 folded precursor RNA into VGAM1683 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1683 RNA is designated SEQ ID:4394, and is provided hereinbelow with reference to the sequence listing part.

[56837] VGAM1683 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1683 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1683 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[56838] VGAM1683 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1683 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1683 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1683 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1683 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[56839] The complementary binding of VGAM1683 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1683 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1683 host target RNA into VGAM1683 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[56840] It is appreciated that VGAM1683 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1683 host target genes. The mRNA of each one of this plurality of VGAM1683 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1683 RNA, herein designated VGAM RNA, and which when bound by VGAM1683 RNA causes inhibition of translation of respective one or more

VGAM1683 host target proteins.

[56841] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1683 gene, herein designated VGAM GENE, on one or more VGAM1683 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[56842] It is yet further appreciated that a function of VGAM1683 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1683 include diagnosis, prevention and treatment of viral infection by Vesicular Stomatitis Indiana

Virus. Specific functions, and accordingly utilities, of VGAM1683 correlate with, and may be deduced from, the identity of the host target genes which VGAM1683 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[56843] Nucleotide sequences of the VGAM1683 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1683 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1683 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1683 are further described hereinbelow with reference to Table 1.

[56844] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1683 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1683 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[56845] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1683 gene, herein designated VGAM is inhibition of expression of VGAM1683 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM1683 correlate with, and may be deduced from, the identity of the target genes which VGAM1683 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[56846] Rac/Cdc42 Guanine Nucleotide Exchange Factor (GEF) 6 (ARHGEF6, Accession XM\_042963) is a VGAM1683 host target gene. ARHGEF6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARHGEF6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGEF6 BINDING SITE, designated SEQ ID:33849, to the nucleotide sequence of VGAM1683 RNA, herein designated VGAM RNA, also designated SEQ ID:4394.

[56847] A function of VGAM1683 is therefore inhibition of Rac/Cdc42 Guanine Nucleotide Exchange Factor (GEF) 6 (ARHGEF6, Accession XM\_042963). Accordingly, utilities of VGAM1683 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGEF6. BIG1 (Accession NM\_006421) is another VGAM1683 host target gene. BIG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region

of mRNA encoded by BIG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BIG1 BINDING SITE, designated SEQ ID:13137, to the nucleotide sequence of VGAM1683 RNA, herein designated VGAM RNA, also designated SEQ ID:4394.

[56848] Another function of VGAM1683 is therefore inhibition of BIG1 (Accession NM\_006421), a gene which is a guanine nucleotide-exchange protein, has a role in vesicular transport. Accordingly, utilities of VGAM1683 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BIG1. The function of BIG1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1190. V-raf-1 Murine Leukemia Viral Oncogene Homolog 1 (RAF1, Accession XM\_087425) is another VGAM1683 host target gene. RAF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of RAF1 BINDING SITE, designated SEQ ID:39246, to the nucleotide sequence of VGAM1683 RNA, herein designated VGAM RNA, also designated SEQ ID:4394.

[56849] Another function of VGAM1683 is therefore inhibition of V-raf-1 Murine Leukemia Viral Oncogene Homolog 1 (RAF1, Accession XM\_087425). Accordingly, utilities of VGAM1683 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAF1. Sal-like 2 (Drosophila) (SALL2, Accession XM\_033473) is another VGAM1683 host target gene. SALL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SALL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SALL2 BINDING SITE, designated SEQ ID:31938, to the nucleotide sequence of VGAM1683 RNA, herein designated VGAM RNA, also designated SEQ ID:4394.

[56850] Another function of VGAM1683 is therefore inhibition of Sal-like 2 (Drosophila) (SALL2, Accession XM\_033473). Accordingly, utilities of VGAM1683 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SALL2. Cysteine and Tyrosine-rich 1

(CYR1, Accession NM\_052954) is another VGAM1683 host target gene. CYR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CYR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYR1 BINDING SITE, designated SEQ ID:27516, to the nucleotide sequence of VGAM1683 RNA, herein designated VGAM RNA, also designated SEQ ID:4394.

[56851] Another function of VGAM1683 is therefore inhibition of Cysteine and Tyrosine-rich 1 (CYR1, Accession NM\_052954). Accordingly, utilities of VGAM1683 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYR1. FLJ13782 (Accession NM\_024915) is another VGAM1683 host target gene. FLJ13782 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13782, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13782 BINDING SITE, designated SEQ ID:24439, to the nucleotide sequence of VGAM1683

RNA, herein designated VGAM RNA, also designated SEQ ID:4394.

[56852] Another function of VGAM1683 is therefore inhibition of FLJ13782 (Accession NM\_024915). Accordingly, utilities of VGAM1683 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13782. KIAA0895 (Accession XM\_166573) is another VGAM1683 host target gene. KIAA0895 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0895, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0895 BINDING SITE, designated SEQ ID:44547, to the nucleotide sequence of VGAM1683 RNA, herein designated VGAM RNA, also designated SEQ ID:4394.

[56853] Another function of VGAM1683 is therefore inhibition of KIAA0895 (Accession XM\_166573). Accordingly, utilities of VGAM1683 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0895. KIAA1255 (Accession XM\_040626) is another VGAM1683 host target gene. KIAA1255 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA1255, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1255 BINDING SITE, designated SEQ ID:33346, to the nucleotide sequence of VGAM1683 RNA, herein designated VGAM RNA, also designated SEQ ID:4394.

[56854] Another function of VGAM1683 is therefore inhibition of KIAA1255 (Accession XM\_040626). Accordingly, utilities of VGAM1683 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1255. KIAA1387 (Accession XM\_048092) is another VGAM1683 host target gene. KIAA1387 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1387, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1387 BINDING SITE, designated SEQ ID:35105, to the nucleotide sequence of VGAM1683 RNA, herein designated VGAM RNA, also designated SEQ ID:4394.

[56855] Another function of VGAM1683 is therefore inhibition of KIAA1387 (Accession XM\_048092). Accordingly, utilities

of VGAM1683 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1387. SCYB10 (Accession NM\_001565) is another VGAM1683 host target gene. SCYB10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCYB10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCYB10 BINDING SITE, designated SEQ ID:7293, to the nucleotide sequence of VGAM1683 RNA, herein designated VGAM RNA, also designated SEQ ID:4394.

[56856] Another function of VGAM1683 is therefore inhibition of SCYB10 (Accession NM\_001565). Accordingly, utilities of VGAM1683 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCYB10. Solute Carrier Family 1 (glutamate transporter), Member 7 (SLC1A7, Accession NM\_006671) is another VGAM1683 host target gene. SLC1A7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC1A7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

complementarity of the nucleotide sequences of SLC1A7 BINDING SITE, designated SEQ ID:13490, to the nucleotide sequence of VGAM1683 RNA, herein designated VGAM RNA, also designated SEQ ID:4394.

[56857] Another function of VGAM1683 is therefore inhibition of Solute Carrier Family 1 (glutamate transporter), Member 7 (SLC1A7, Accession NM\_006671). Accordingly, utilities of VGAM1683 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC1A7. LOC203339 (Accession XM\_117534) is another VGAM1683 host target gene. LOC203339 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC203339, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203339 BINDING SITE, designated SEQ ID:43527, to the nucleotide sequence of VGAM1683 RNA, herein designated VGAM RNA, also designated SEQ ID:4394.

[56858] Another function of VGAM1683 is therefore inhibition of LOC203339 (Accession XM\_117534). Accordingly, utilities of VGAM1683 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC203339. LOC222234 (Accession XM\_168558) is another VGAM1683 host target gene. LOC222234 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222234, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222234 BINDING SITE, designated SEQ ID:45239, to the nucleotide sequence of VGAM1683 RNA, herein designated VGAM RNA, also designated SEQ ID:4394.

[56859] Another function of VGAM1683 is therefore inhibition of LOC222234 (Accession XM\_168558). Accordingly, utilities of VGAM1683 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222234. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1684 (VGAM1684) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[56860] VGAM1684 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1684 was detected is described hereinabove with reference to Figs. 1–8.

[56861] VGAM1684 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vesicular Stomatitis Indiana Virus. VGAM1684 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[56862] VGAM1684 gene encodes a VGAM1684 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1684 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1684 precursor RNA is designated SEQ ID:1670, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1670 is located at position 5581 relative to the genome of Vesicular Stomatitis Indiana Virus.

[56863] VGAM1684 precursor RNA folds onto itself, forming VGAM1684 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[56864] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1684 folded precursor RNA into VGAM1684 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 68%) nucleotide sequence of VGAM1684 RNA is designated SEQ ID:4395, and is provided hereinbelow with reference to the sequence listing part.

[56865] VGAM1684 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1684 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1684 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[56866] VGAM1684 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1684 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1684 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1684 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1684 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[56867] The complementary binding of VGAM1684 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1684 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1684 host target RNA into VGAM1684 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[56868] It is appreciated that VGAM1684 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1684 host target genes. The mRNA of each one of this plurality of VGAM1684 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1684 RNA, herein designated VGAM RNA, and which when bound by VGAM1684 RNA causes inhibition of translation of respective one or more VGAM1684 host target proteins.

[56869] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1684 gene, herein designated VGAM GENE, on one or more VGAM1684 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[56870] It is yet further appreciated that a function of VGAM1684 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1684 include diagnosis, prevention and treatment of viral infection by Vesicular Stomatitis Indiana Virus. Specific functions, and accordingly utilities, of VGAM1684 correlate with, and may be deduced from, the identity of the host target genes which VGAM1684 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[56871] Nucleotide sequences of the VGAM1684 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1684 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM1684 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1684 are further described hereinbelow with reference to Table 1.

[56872] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1684 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1684 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[56873] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1684 gene, herein designated VGAM is inhibition of expression of VGAM1684 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1684 correlate with, and may be deduced from, the identity of the target genes which VGAM1684 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[56874] Sorting Nexin 3 (SNX3, Accession NM\_003795) is a VGAM1684 host target gene. SNX3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SNX3, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNX3 BINDING SITE, designated SEQ ID:9876, to the nucleotide sequence of VGAM1684 RNA, herein designated VGAM RNA, also designated SEQ ID:4395.

[56875] A function of VGAM1684 is therefore inhibition of Sorting Nexin 3 (SNX3, Accession NM\_003795). Accordingly, utilities of VGAM1684 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNX3. LOC115265 (Accession XM\_055596) is another VGAM1684 host target gene. LOC115265 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC115265, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115265 BINDING SITE, designated SEQ ID:36305, to the nucleotide sequence of VGAM1684 RNA, herein designated VGAM RNA, also designated SEQ ID:4395.

[56876] Another function of VGAM1684 is therefore inhibition of LOC115265 (Accession XM\_055596). Accordingly, utilities of VGAM1684 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC115265. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1685 (VGAM1685) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[56877] VGAM1685 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1685 was detected is described hereinabove with reference to Figs. 1–8.

[56878] VGAM1685 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vesicular Stomatitis Indiana Virus. VGAM1685 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[56879] VGAM1685 gene encodes a VGAM1685 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1685 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1685 precursor RNA is desig-

nated SEQ ID:1671, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1671 is located at position 4965 relative to the genome of Vesicular Stomatitis Indiana Virus.

- [56880] VGAM1685 precursor RNA folds onto itself, forming VGAM1685 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [56881] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1685 folded precursor RNA into VGAM1685 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 61%) nucleotide sequence of VGAM1685 RNA is designated SEQ ID:4396, and is provided hereinbelow with reference to the sequence

listing part.

[56882] VGAM1685 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1685 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1685 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[56883] VGAM1685 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1685 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1685 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1685 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM1685 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[56884] The complementary binding of VGAM1685 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1685 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1685 host target RNA into VGAM1685 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[56885] It is appreciated that VGAM1685 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1685 host target genes. The mRNA of each one of this plurality of VGAM1685 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1685 RNA, herein designated VGAM

RNA, and which when bound by VGAM1685 RNA causes inhibition of translation of respective one or more VGAM1685 host target proteins.

[56886] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1685 gene, herein designated VGAM GENE, on one or more VGAM1685 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[56887] It is yet further appreciated that a function of VGAM1685 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1685 include diagnosis, prevention and treatment of viral infection by Vesicular Stomatitis Indiana Virus. Specific functions, and accordingly utilities, of VGAM1685 correlate with, and may be deduced from, the identity of the host target genes which VGAM1685 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[56888] Nucleotide sequences of the VGAM1685 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1685 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1685 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1685 are further described hereinbelow with reference to Table 1.

[56889] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1685 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1685 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[56890] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1685 gene, herein designated VGAM is

inhibition of expression of VGAM1685 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1685 correlate with, and may be deduced from, the identity of the target genes which VGAM1685 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[56891] TU3A (Accession NM\_007177) is a VGAM1685 host target gene. TU3A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TU3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TU3A BINDING SITE, designated SEQ ID:14035, to the nucleotide sequence of VGAM1685 RNA, herein designated VGAM RNA, also designated SEQ ID:4396.

[56892] A function of VGAM1685 is therefore inhibition of TU3A (Accession NM\_007177). Accordingly, utilities of VGAM1685 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TU3A. LOC257481 (Accession XM\_028192) is another VGAM1685 host target gene. LOC257481 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257481, corresponding

to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257481 BINDING SITE, designated SEQ ID:30631, to the nucleotide sequence of VGAM1685 RNA, herein designated VGAM RNA, also designated SEQ ID:4396.

[56893] Another function of VGAM1685 is therefore inhibition of LOC257481 (Accession XM\_028192). Accordingly, utilities of VGAM1685 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257481. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1686 (VGAM1686) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[56894] VGAM1686 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1686 was detected is described hereinabove with reference to Figs. 1-8.

[56895] VGAM1686 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vesicular Stomatitis In-

diana Virus. VGAM1686 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[56896] VGAM1686 gene encodes a VGAM1686 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1686 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1686 precursor RNA is designated SEQ ID:1672, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1672 is located at position 2116 relative to the genome of Vesicular Stomatitis Indiana Virus.

[56897] VGAM1686 precursor RNA folds onto itself, forming VGAM1686 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[56898] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM1686 folded precursor RNA into VGAM1686 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM1686 RNA is designated SEQ ID:4397, and is provided hereinbelow with reference to the sequence listing part.

[56899] VGAM1686 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1686 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1686 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[56900] VGAM1686 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1686 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1686 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1686 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1686 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[56901] The complementary binding of VGAM1686 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1686 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1686 host target RNA into VGAM1686 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[56902] It is appreciated that VGAM1686 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1686 host target genes. The mRNA of each one of this plurality of VGAM1686 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1686 RNA, herein designated VGAM RNA, and which when bound by VGAM1686 RNA causes inhibition of translation of respective one or more VGAM1686 host target proteins.

[56903] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1686 gene, herein designated VGAM GENE, on one or more VGAM1686 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[56904] It is yet further appreciated that a function of VGAM1686 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1686 include diagnosis, prevention and treatment of viral infection by Vesicular Stomatitis Indiana Virus. Specific functions, and accordingly utilities, of VGAM1686 correlate with, and may be deduced from, the identity of the host target genes which VGAM1686 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[56905] Nucleotide sequences of the VGAM1686 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1686 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1686 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1686 are further described hereinbelow with reference to Table 1.

[56906] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1686 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1686 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[56907] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1686 gene, herein designated VGAM is inhibition of expression of VGAM1686 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1686 correlate with, and may be deduced from, the identity of the target genes which VGAM1686 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[56908] ATP-binding Cassette, Sub-family C (CFTR/MRP), Member 12 (ABCC12, Accession NM\_033226) is a VGAM1686 host target gene. ABCC12 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ABCC12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCC12 BINDING SITE,

designated SEQ ID:27072, to the nucleotide sequence of VGAM1686 RNA, herein designated VGAM RNA, also designated SEQ ID:4397.

[56909] A function of VGAM1686 is therefore inhibition of ATP-binding Cassette, Sub-family C (CFTR/MRP), Member 12 (ABCC12, Accession NM\_033226), a gene which acts as a multispecific organic anion pump which can transport nucleotide analogs (by similarity). Accordingly, utilities of VGAM1686 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCC12. The function of ABCC12 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1246. Axin 1 (AXIN1, Accession XM\_027520) is another VGAM1686 host target gene. AXIN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AXIN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AXIN1 BINDING SITE, designated SEQ ID:30518, to the nucleotide sequence of VGAM1686 RNA, herein designated VGAM RNA, also designated SEQ

ID:4397.

[56910] Another function of VGAM1686 is therefore inhibition of Axin 1 (AXIN1, Accession XM\_027520). Accordingly, utilities of VGAM1686 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AXIN1. Potassium Channel, Subfamily K, Member 5 (KCNK5, Accession NM\_003740) is another VGAM1686 host target gene. KCNK5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KCNK5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNK5 BINDING SITE, designated SEQ ID:9828, to the nucleotide sequence of VGAM1686 RNA, herein designated VGAM RNA, also designated SEQ ID:4397.

[56911] Another function of VGAM1686 is therefore inhibition of Potassium Channel, Subfamily K, Member 5 (KCNK5, Accession NM\_003740). Accordingly, utilities of VGAM1686 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNK5. L1 Cell Adhesion Molecule (hydrocephalus, stenosis of aqueduct of Sylvius 1, MASA (mental retardation, aphasia, shuffling

gait and adducted thumbs) Syndrome, Spastic Paraplegia 1) (L1CAM, Accession NM\_000425) is another VGAM1686 host target gene. L1CAM BINDING SITE1 and L1CAM BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by L1CAM, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of L1CAM BINDING SITE1 and L1CAM BINDING SITE2, designated SEQ ID:6003 and SEQ ID:23431 respectively, to the nucleotide sequence of VGAM1686 RNA, herein designated VGAM RNA, also designated SEQ ID:4397.

[56912] Another function of VGAM1686 is therefore inhibition of L1 Cell Adhesion Molecule (hydrocephalus, stenosis of aqueduct of Sylvius 1, MASA (mental retardation, aphasia, shuffling gait and adducted thumbs) Syndrome, Spastic Paraplegia 1) (L1CAM, Accession NM\_000425). Accordingly, utilities of VGAM1686 include diagnosis, prevention and treatment of diseases and clinical conditions associated with L1CAM. Peroxisome Biogenesis Factor 10 (PEX10, Accession NM\_002617) is another VGAM1686 host target gene. PEX10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by PEX10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PEX10 BINDING SITE, designated SEQ ID:8479, to the nucleotide sequence of VGAM1686 RNA, herein designated VGAM RNA, also designated SEQ ID:4397.

[56913] Another function of VGAM1686 is therefore inhibition of Peroxisome Biogenesis Factor 10 (PEX10, Accession NM\_002617). Accordingly, utilities of VGAM1686 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PEX10. Phosphoinositide-3-kinase, Regulatory Subunit, Polypeptide 1 (p85 alpha) (PIK3R1, Accession XM\_043865) is another VGAM1686 host target gene. PIK3R1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PIK3R1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIK3R1 BINDING SITE, designated SEQ ID:34036, to the nucleotide sequence of VGAM1686 RNA, herein designated VGAM RNA, also designated SEQ ID:4397.

[56914] Another function of VGAM1686 is therefore inhibition of Phosphoinositide-3-kinase, Regulatory Subunit, Polypeptide 1 (p85 alpha) (PIK3R1, Accession XM\_043865), a gene which acts as an adapter, for the insulin-stimulated increase in glucose uptake and glycogen synthesis. Accordingly, utilities of VGAM1686 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIK3R1. The function of PIK3R1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM826. Serine Hydroxymethyltransferase 1 (soluble) (SHMT1, Accession NM\_004169) is another VGAM1686 host target gene. SHMT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SHMT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SHMT1 BINDING SITE, designated SEQ ID:10374, to the nucleotide sequence of VGAM1686 RNA, herein designated VGAM RNA, also designated SEQ ID:4397.

[56915] Another function of VGAM1686 is therefore inhibition of

Serine Hydroxymethyltransferase 1 (soluble) (SHMT1, Accession NM\_004169), a gene which interconverts serine and glycine. Accordingly, utilities of VGAM1686 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SHMT1. The function of SHMT1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM475. Tumor Necrosis Factor, Alpha-induced Protein 1 (endothelial) (TNFAIP1, Accession NM\_021137) is another VGAM1686 host target gene. TNFAIP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TNFAIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFAIP1 BINDING SITE, designated SEQ ID:22113, to the nucleotide sequence of VGAM1686 RNA, herein designated VGAM RNA, also designated SEQ ID:4397.

[56916] Another function of VGAM1686 is therefore inhibition of Tumor Necrosis Factor, Alpha-induced Protein 1 (endothelial) (TNFAIP1, Accession NM\_021137). Accordingly, utilities of VGAM1686 include diagnosis, prevention

and treatment of diseases and clinical conditions associated with TNFAIP1. Vang-like 2 (van gogh, *Drosophila*) (VANGL2, Accession XM\_049695) is another VGAM1686 host target gene. VANGL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VANGL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VANGL2 BINDING SITE, designated SEQ ID:35480, to the nucleotide sequence of VGAM1686 RNA, herein designated VGAM RNA, also designated SEQ ID:4397.

[56917] Another function of VGAM1686 is therefore inhibition of Vang-like 2 (van gogh, *Drosophila*) (VANGL2, Accession XM\_049695), a gene which may take part in defining the lateral boundary of floorplate differentiation. Accordingly, utilities of VGAM1686 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VANGL2. The function of VANGL2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM111.DKFZP434J046 (Accession XM\_048258) is another VGAM1686 host target gene. DK-

FZP434J046 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP434J046, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434J046 BINDING SITE, designated SEQ ID:35150, to the nucleotide sequence of VGAM1686 RNA, herein designated VGAM RNA, also designated SEQ ID:4397.

[56918] Another function of VGAM1686 is therefore inhibition of DKFZP434J046 (Accession XM\_048258). Accordingly, utilities of VGAM1686 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434J046. FLJ10385 (Accession NM\_018081) is another VGAM1686 host target gene. FLJ10385 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ10385, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10385 BINDING SITE, designated SEQ ID:19840, to the nucleotide sequence of VGAM1686 RNA, herein designated VGAM RNA, also designated SEQ ID:4397.

[56919] Another function of VGAM1686 is therefore inhibition of FLJ10385 (Accession NM\_018081). Accordingly, utilities of VGAM1686 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10385. FLJ12876 (Accession NM\_022754) is another VGAM1686 host target gene. FLJ12876 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12876, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12876 BINDING SITE, designated SEQ ID:22987, to the nucleotide sequence of VGAM1686 RNA, herein designated VGAM RNA, also designated SEQ ID:4397.

[56920] Another function of VGAM1686 is therefore inhibition of FLJ12876 (Accession NM\_022754). Accordingly, utilities of VGAM1686 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12876. FLJ20375 (Accession NM\_017794) is another VGAM1686 host target gene. FLJ20375 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20375, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20375 BINDING SITE, designated SEQ ID:19433, to the nucleotide sequence of VGAM1686 RNA, herein designated VGAM RNA, also designated SEQ ID:4397.

[56921] Another function of VGAM1686 is therefore inhibition of FLJ20375 (Accession NM\_017794). Accordingly, utilities of VGAM1686 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20375. FLJ22625 (Accession NM\_024715) is another VGAM1686 host target gene. FLJ22625 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ22625, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22625 BINDING SITE, designated SEQ ID:24042, to the nucleotide sequence of VGAM1686 RNA, herein designated VGAM RNA, also designated SEQ ID:4397.

[56922] Another function of VGAM1686 is therefore inhibition of FLJ22625 (Accession NM\_024715). Accordingly, utilities of VGAM1686 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ22625. GR6 (Accession NM\_007354) is another VGAM1686 host target gene. GR6 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GR6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GR6 BINDING SITE, designated SEQ ID:14280, to the nucleotide sequence of VGAM1686 RNA, herein designated VGAM RNA, also designated SEQ ID:4397.

[56923] Another function of VGAM1686 is therefore inhibition of GR6 (Accession NM\_007354). Accordingly, utilities of VGAM1686 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GR6. KIAA0451 (Accession NM\_014826) is another VGAM1686 host target gene. KIAA0451 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0451, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0451 BINDING SITE, designated SEQ ID:16807, to the nucleotide sequence of VGAM1686 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4397.

[56924] Another function of VGAM1686 is therefore inhibition of KIAA0451 (Accession NM\_014826). Accordingly, utilities of VGAM1686 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0451. KIAA0544 (Accession XM\_048119) is another VGAM1686 host target gene. KIAA0544 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0544, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0544 BINDING SITE, designated SEQ ID:35109, to the nucleotide sequence of VGAM1686 RNA, herein designated VGAM RNA, also designated SEQ ID:4397.

[56925] Another function of VGAM1686 is therefore inhibition of KIAA0544 (Accession XM\_048119). Accordingly, utilities of VGAM1686 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0544. MGC12435 (Accession NM\_031427) is another VGAM1686 host target gene. MGC12435 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC12435, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC12435 BINDING SITE, designated SEQ ID:25423, to the nucleotide sequence of VGAM1686 RNA, herein designated VGAM RNA, also designated SEQ ID:4397.

[56926] Another function of VGAM1686 is therefore inhibition of MGC12435 (Accession NM\_031427). Accordingly, utilities of VGAM1686 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC12435. MGC29643 (Accession NM\_144586) is another VGAM1686 host target gene. MGC29643 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC29643, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC29643 BINDING SITE, designated SEQ ID:29406, to the nucleotide sequence of VGAM1686 RNA, herein designated VGAM RNA, also designated SEQ ID:4397.

[56927] Another function of VGAM1686 is therefore inhibition of MGC29643 (Accession NM\_144586). Accordingly, utilities of VGAM1686 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with MGC29643. Oxysterol Binding Protein-like 5 (OSBPL5, Accession XM\_052567) is another VGAM1686 host target gene. OSBPL5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OSBPL5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSBPL5 BINDING SITE, designated SEQ ID:35988, to the nucleotide sequence of VGAM1686 RNA, herein designated VGAM RNA, also designated SEQ ID:4397.

[56928] Another function of VGAM1686 is therefore inhibition of Oxysterol Binding Protein-like 5 (OSBPL5, Accession XM\_052567). Accordingly, utilities of VGAM1686 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL5. Tubby Homolog (mouse) (TUB, Accession NM\_003320) is another VGAM1686 host target gene. TUB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TUB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of TUB BINDING SITE, designated SEQ ID:9319, to the nucleotide sequence of VGAM1686 RNA, herein designated VGAM RNA, also designated SEQ ID:4397.

[56929] Another function of VGAM1686 is therefore inhibition of Tubby Homolog (mouse) (TUB, Accession NM\_003320). Accordingly, utilities of VGAM1686 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TUB. LOC119188 (Accession XM\_058373) is another VGAM1686 host target gene. LOC119188 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC119188, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC119188 BINDING SITE, designated SEQ ID:36613, to the nucleotide sequence of VGAM1686 RNA, herein designated VGAM RNA, also designated SEQ ID:4397.

[56930] Another function of VGAM1686 is therefore inhibition of LOC119188 (Accession XM\_058373). Accordingly, utilities of VGAM1686 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC119188. LOC145717 (Accession XM\_039771) is another VGAM1686 host target gene. LOC145717 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145717, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145717 BINDING SITE, designated SEQ ID:33190, to the nucleotide sequence of VGAM1686 RNA, herein designated VGAM RNA, also designated SEQ ID:4397.

[56931] Another function of VGAM1686 is therefore inhibition of LOC145717 (Accession XM\_039771). Accordingly, utilities of VGAM1686 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145717. LOC146795 (Accession XM\_085593) is another VGAM1686 host target gene. LOC146795 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146795, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146795 BINDING SITE, designated SEQ ID:38244, to the nucleotide sequence of VGAM1686 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4397.

[56932] Another function of VGAM1686 is therefore inhibition of LOC146795 (Accession XM\_085593). Accordingly, utilities of VGAM1686 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146795. LOC151176 (Accession XM\_098016) is another VGAM1686 host target gene. LOC151176 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151176, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151176 BINDING SITE, designated SEQ ID:41317, to the nucleotide sequence of VGAM1686 RNA, herein designated VGAM RNA, also designated SEQ ID:4397.

[56933] Another function of VGAM1686 is therefore inhibition of LOC151176 (Accession XM\_098016). Accordingly, utilities of VGAM1686 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151176. LOC152453 (Accession XM\_087475) is another VGAM1686 host target gene. LOC152453 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152453, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152453 BINDING SITE, designated SEQ ID:39276, to the nucleotide sequence of VGAM1686 RNA, herein designated VGAM RNA, also designated SEQ ID:4397.

[56934] Another function of VGAM1686 is therefore inhibition of LOC152453 (Accession XM\_087475). Accordingly, utilities of VGAM1686 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152453. LOC155061 (Accession XM\_088139) is another VGAM1686 host target gene. LOC155061 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC155061, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155061 BINDING SITE, designated SEQ ID:39536, to the nucleotide sequence of VGAM1686 RNA, herein designated VGAM RNA, also designated SEQ ID:4397.

[56935] Another function of VGAM1686 is therefore inhibition of LOC155061 (Accession XM\_088139). Accordingly, utilities of VGAM1686 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC155061. LOC197342 (Accession XM\_113869) is another VGAM1686 host target gene. LOC197342 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC197342, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197342 BINDING SITE, designated SEQ ID:42488, to the nucleotide sequence of VGAM1686 RNA, herein designated VGAM RNA, also designated SEQ ID:4397.

[56936] Another function of VGAM1686 is therefore inhibition of LOC197342 (Accession XM\_113869). Accordingly, utilities of VGAM1686 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197342. LOC201689 (Accession XM\_040608) is another VGAM1686 host target gene. LOC201689 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC201689, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201689 BINDING SITE, designated SEQ ID:33332, to

the nucleotide sequence of VGAM1686 RNA, herein designated VGAM RNA, also designated SEQ ID:4397.

[56937] Another function of VGAM1686 is therefore inhibition of LOC201689 (Accession XM\_040608). Accordingly, utilities of VGAM1686 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201689. LOC221140 (Accession XM\_167908) is another VGAM1686 host target gene. LOC221140 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221140, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221140 BINDING SITE, designated SEQ ID:44907, to the nucleotide sequence of VGAM1686 RNA, herein designated VGAM RNA, also designated SEQ ID:4397.

[56938] Another function of VGAM1686 is therefore inhibition of LOC221140 (Accession XM\_167908). Accordingly, utilities of VGAM1686 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221140. LOC222166 (Accession XM\_168425) is another VGAM1686 host target gene. LOC222166 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC222166, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222166 BINDING SITE, designated SEQ ID:45151, to the nucleotide sequence of VGAM1686 RNA, herein designated VGAM RNA, also designated SEQ ID:4397.

[56939] Another function of VGAM1686 is therefore inhibition of LOC222166 (Accession XM\_168425). Accordingly, utilities of VGAM1686 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222166. LOC254431 (Accession XM\_173024) is another VGAM1686 host target gene. LOC254431 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254431, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254431 BINDING SITE, designated SEQ ID:46290, to the nucleotide sequence of VGAM1686 RNA, herein designated VGAM RNA, also designated SEQ ID:4397.

[56940] Another function of VGAM1686 is therefore inhibition of LOC254431 (Accession XM\_173024). Accordingly, utilities

of VGAM1686 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254431. LOC91974 (Accession XM\_041974) is another VGAM1686 host target gene. LOC91974 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91974, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91974 BINDING SITE, designated SEQ ID:33653, to the nucleotide sequence of VGAM1686 RNA, herein designated VGAM RNA, also designated SEQ ID:4397.

[56941] Another function of VGAM1686 is therefore inhibition of LOC91974 (Accession XM\_041974). Accordingly, utilities of VGAM1686 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91974. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1687 (VGAM1687) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[56942] VGAM1687 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1687 was detected is described hereinabove with reference to Figs. 1-8.

[56943] VGAM1687 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee Cytomegalovirus. VGAM1687 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[56944] VGAM1687 gene encodes a VGAM1687 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1687 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1687 precursor RNA is designated SEQ ID:1673, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1673 is located at position 126333 relative to the genome of Chimpanzee Cytomegalovirus.

[56945] VGAM1687 precursor RNA folds onto itself, forming VGAM1687 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[56946] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1687 folded precursor RNA into VGAM1687 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM1687 RNA is designated SEQ ID:4398, and is provided hereinbelow with reference to the sequence listing part.

[56947] VGAM1687 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1687 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1687 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[56948] VGAM1687 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1687 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1687 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1687 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1687 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[56949] The complementary binding of VGAM1687 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1687 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1687 host target RNA into VGAM1687 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[56950] It is appreciated that VGAM1687 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1687 host target genes. The mRNA of each one of this plurality of VGAM1687 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1687 RNA, herein designated VGAM RNA, and which when bound by VGAM1687 RNA causes inhibition of translation of respective one or more VGAM1687 host target proteins.

[56951] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1687 gene, herein designated VGAM GENE, on one or more VGAM1687 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[56952] It is yet further appreciated that a function of VGAM1687 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1687 include diagnosis, prevention and treatment of viral infection by Chimpanzee Cytomegalovirus. Specific functions, and accordingly utilities, of VGAM1687 correlate with, and may be deduced from, the identity of the host target genes which VGAM1687 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[56953] Nucleotide sequences of the VGAM1687 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the  
`diced` VGAM1687 RNA, herein designated VGAM RNA,  
and a schematic representation of the secondary folding  
of VGAM1687 folded precursor RNA, herein designated  
VGAM FOLDED PRECURSOR RNA, of VGAM1687 are further  
described hereinbelow with reference to Table 1.

[56954] Nucleotide sequences of host target binding sites, such as  
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of  
Fig. 1, found on VGAM1687 host target RNA, and  
schematic representation of the complementarity of each  
of these host target binding sites to VGAM1687 RNA,  
herein designated VGAM RNA, are described hereinbelow  
with reference to Table 2.

[56955] As mentioned hereinabove with reference to Fig. 1, a  
function of VGAM1687 gene, herein designated VGAM is  
inhibition of expression of VGAM1687 target genes. It is  
appreciated that specific functions, and accordingly utili-  
ties, of VGAM1687 correlate with, and may be deduced  
from, the identity of the target genes which VGAM1687  
binds and inhibits, and the function of these target genes,  
as elaborated hereinbelow.

[56956] Cadherin, EGF LAG Seven-pass G-type Receptor 1  
(flamingo homolog, Drosophila) (CELSR1, Accession

NM\_014246) is a VGAM1687 host target gene. CELSR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CELSR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CELSR1 BINDING SITE, designated SEQ ID:15516, to the nucleotide sequence of VGAM1687 RNA, herein designated VGAM RNA, also designated SEQ ID:4398.

[56957] A function of VGAM1687 is therefore inhibition of Cadherin, EGF LAG Seven-pass G-type Receptor 1 (flamingo homolog, Drosophila) (CELSR1, Accession NM\_014246), a gene which is involved in contact-mediated communication. Accordingly, utilities of VGAM1687 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CELSR1. The function of CELSR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM459. Solute Carrier Family 7 (cationic amino acid transporter,  $\gamma^+$  system), Member 6 (SLC7A6, Accession NM\_003983) is another VGAM1687 host target gene. SLC7A6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by SLC7A6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC7A6 BINDING SITE, designated SEQ ID:10125, to the nucleotide sequence of VGAM1687 RNA, herein designated VGAM RNA, also designated SEQ ID:4398.

[56958] Another function of VGAM1687 is therefore inhibition of Solute Carrier Family 7 (cationic amino acid transporter,  $\gamma^+$  system), Member 6 (SLC7A6, Accession NM\_003983), a gene which is involved in mediating amino acid transport. Accordingly, utilities of VGAM1687 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC7A6. The function of SLC7A6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM87. LOC120826 (Accession XM\_062302) is another VGAM1687 host target gene. LOC120826 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC120826, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC120826 BINDING SITE, designated SEQ ID:37223, to the nucleotide sequence of VGAM1687 RNA, herein designated VGAM RNA, also designated SEQ ID:4398.

[56959] Another function of VGAM1687 is therefore inhibition of LOC120826 (Accession XM\_062302). Accordingly, utilities of VGAM1687 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120826. LOC160717 (Accession XM\_090457) is another VGAM1687 host target gene. LOC160717 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC160717, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC160717 BINDING SITE, designated SEQ ID:40007, to the nucleotide sequence of VGAM1687 RNA, herein designated VGAM RNA, also designated SEQ ID:4398.

[56960] Another function of VGAM1687 is therefore inhibition of LOC160717 (Accession XM\_090457). Accordingly, utilities of VGAM1687 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC160717. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1688 (VGAM1688) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[56961] VGAM1688 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1688 was detected is described hereinabove with reference to Figs. 1–8.

[56962] VGAM1688 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee Cytomegalovirus. VGAM1688 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[56963] VGAM1688 gene encodes a VGAM1688 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1688 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1688 precursor RNA is designated SEQ ID:1674, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:1674 is located at position 123345 relative to the genome of Chimpanzee Cytomegalovirus.

[56964] VGAM1688 precursor RNA folds onto itself, forming VGAM1688 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[56965] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1688 folded precursor RNA into VGAM1688 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1688 RNA is designated SEQ ID:4399, and is provided hereinbelow with reference to the sequence listing part.

[56966] VGAM1688 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1688 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1688 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[56967] VGAM1688 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1688 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1688 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1688 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1688 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[56968] The complementary binding of VGAM1688 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1688 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1688 host target RNA into VGAM1688 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[56969] It is appreciated that VGAM1688 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1688 host target genes. The mRNA of each one of this plurality of VGAM1688 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1688 RNA, herein designated VGAM RNA, and which when bound by VGAM1688 RNA causes inhibition of translation of respective one or more

VGAM1688 host target proteins.

[56970] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1688 gene, herein designated VGAM GENE, on one or more VGAM1688 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[56971] It is yet further appreciated that a function of VGAM1688 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1688 include diagnosis, prevention and treatment of viral infection by Chimpanzee Cy-

tomegalovirus. Specific functions, and accordingly utilities, of VGAM1688 correlate with, and may be deduced from, the identity of the host target genes which VGAM1688 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[56972] Nucleotide sequences of the VGAM1688 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1688 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1688 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1688 are further described hereinbelow with reference to Table 1.

[56973] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1688 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1688 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[56974] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1688 gene, herein designated VGAM is inhibition of expression of VGAM1688 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM1688 correlate with, and may be deduced from, the identity of the target genes which VGAM1688 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[56975] Extra Spindle Poles Like 1 (*S. cerevisiae*) (ESPL1, Accession NM\_012291) is a VGAM1688 host target gene. ESPL1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ESPL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ESPL1 BINDING SITE, designated SEQ ID:14630, to the nucleotide sequence of VGAM1688 RNA, herein designated VGAM RNA, also designated SEQ ID:4399.

[56976] A function of VGAM1688 is therefore inhibition of Extra Spindle Poles Like 1 (*S. cerevisiae*) (ESPL1, Accession NM\_012291). Accordingly, utilities of VGAM1688 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ESPL1. KIAA0515 (Accession XM\_033380) is another VGAM1688 host target gene. KIAA0515 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0515, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0515 BINDING SITE, designated SEQ ID:31918, to the nucleotide sequence of VGAM1688 RNA, herein designated VGAM RNA, also designated SEQ ID:4399.

[56977] Another function of VGAM1688 is therefore inhibition of KIAA0515 (Accession XM\_033380). Accordingly, utilities of VGAM1688 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0515. LOC255937 (Accession XM\_171129) is another VGAM1688 host target gene. LOC255937 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255937, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255937 BINDING SITE, designated SEQ ID:45931, to the nucleotide sequence of VGAM1688 RNA, herein designated VGAM RNA, also designated SEQ ID:4399.

[56978] Another function of VGAM1688 is therefore inhibition of LOC255937 (Accession XM\_171129). Accordingly, utilities of VGAM1688 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC255937. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1689 (VGAM1689) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[56979] VGAM1689 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1689 was detected is described hereinabove with reference to Figs. 1–8.

[56980] VGAM1689 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee Cytomegalovirus. VGAM1689 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[56981] VGAM1689 gene encodes a VGAM1689 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1689 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1689 precursor RNA is desig-

nated SEQ ID:1675, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1675 is located at position 127857 relative to the genome of Chimpanzee Cytomegalovirus.

- [56982] VGAM1689 precursor RNA folds onto itself, forming VGAM1689 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [56983] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1689 folded precursor RNA into VGAM1689 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1689 RNA is designated SEQ ID:4400, and is provided hereinbelow with reference to the sequence

listing part.

[56984] VGAM1689 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1689 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1689 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[56985] VGAM1689 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1689 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1689 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1689 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM1689 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[56986] The complementary binding of VGAM1689 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1689 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1689 host target RNA into VGAM1689 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[56987] It is appreciated that VGAM1689 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1689 host target genes. The mRNA of each one of this plurality of VGAM1689 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1689 RNA, herein designated VGAM

RNA, and which when bound by VGAM1689 RNA causes inhibition of translation of respective one or more VGAM1689 host target proteins.

[56988] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1689 gene, herein designated VGAM GENE, on one or more VGAM1689 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[56989] It is yet further appreciated that a function of VGAM1689 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1689 include diagnosis, prevention and treatment of viral infection by Chimpanzee Cytomegalovirus. Specific functions, and accordingly utilities, of VGAM1689 correlate with, and may be deduced from, the identity of the host target genes which VGAM1689 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[56990] Nucleotide sequences of the VGAM1689 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1689 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1689 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1689 are further described hereinbelow with reference to Table 1.

[56991] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1689 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1689 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[56992] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1689 gene, herein designated VGAM is

inhibition of expression of VGAM1689 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1689 correlate with, and may be deduced from, the identity of the target genes which VGAM1689 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[56993] Diacylglycerol O-acyltransferase Homolog 1 (mouse) (DGAT1, Accession XM\_035370) is a VGAM1689 host target gene. DGAT1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DGAT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DGAT1 BINDING SITE, designated SEQ ID:32236, to the nucleotide sequence of VGAM1689 RNA, herein designated VGAM RNA, also designated SEQ ID:4400.

[56994] A function of VGAM1689 is therefore inhibition of Diacylglycerol O-acyltransferase Homolog 1 (mouse) (DGAT1, Accession XM\_035370). Accordingly, utilities of VGAM1689 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DGAT1. Protein Phosphatase 2, Regulatory Subunit B (B56), Alpha

Isoform (PPP2R5A, Accession NM\_006243) is another VGAM1689 host target gene. PPP2R5A BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PPP2R5A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP2R5A BINDING SITE, designated SEQ ID:12910, to the nucleotide sequence of VGAM1689 RNA, herein designated VGAM RNA, also designated SEQ ID:4400.

[56995] Another function of VGAM1689 is therefore inhibition of Protein Phosphatase 2, Regulatory Subunit B (B56), Alpha Isoform (PPP2R5A, Accession NM\_006243), a gene which is a regulatory subunit of protein phosphatase 2A. Accordingly, utilities of VGAM1689 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP2R5A. The function of PPP2R5A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM675. Roundabout, Axon Guidance Receptor, Homolog 1 (Drosophila) (ROBO1, Accession NM\_133631) is another VGAM1689 host target gene. ROBO1 BINDING SITE is HOST TARGET

binding site found in the 5` untranslated region of mRNA encoded by ROBO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ROBO1 BINDING SITE, designated SEQ ID:28584, to the nucleotide sequence of VGAM1689 RNA, herein designated VGAM RNA, also designated SEQ ID:4400.

[56996] Another function of VGAM1689 is therefore inhibition of Roundabout, Axon Guidance Receptor, Homolog 1 (Drosophila) (ROBO1, Accession NM\_133631), a gene which is an axon guidance receptor. Accordingly, utilities of VGAM1689 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ROBO1. The function of ROBO1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM37. Short Stature Homeobox (SHOX, Accession NM\_000451) is another VGAM1689 host target gene. SHOX BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SHOX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Ta-

ble 2 illustrates the complementarity of the nucleotide sequences of SHOX BINDING SITE, designated SEQ ID:6058, to the nucleotide sequence of VGAM1689 RNA, herein designated VGAM RNA, also designated SEQ ID:4400.

[56997] Another function of VGAM1689 is therefore inhibition of Short Stature Homeobox (SHOX, Accession NM\_000451). Accordingly, utilities of VGAM1689 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SHOX. Telomeric Repeat Binding Factor 2 (TERF2, Accession NM\_005652) is another VGAM1689 host target gene. TERF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TERF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TERF2 BINDING SITE, designated SEQ ID:12188, to the nucleotide sequence of VGAM1689 RNA, herein designated VGAM RNA, also designated SEQ ID:4400.

[56998] Another function of VGAM1689 is therefore inhibition of Telomeric Repeat Binding Factor 2 (TERF2, Accession NM\_005652), a gene which plays a key role in the protective activity of telomeres. Accordingly, utilities of

VGAM1689 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRF2. The function of TRF2 has been established by previous studies. Van Steensel et al. (1998) showed that the human telomeric protein TRF2 plays a key role in the protective activity of telomeres. A dominant-negative allele of TRF2 induced end-to-end chromosome fusions detectable in metaphase and anaphase cells. Telomeric DNA persisted at the fusions, demonstrating that TTAGGG repeats per se are not sufficient for telomere integrity. Molecular analysis suggested that the fusions represented ligation of telomeres that have lost their single-stranded G-tails. Van Steensel et al. (1998) concluded that TRF2 may protect chromosome ends by maintaining the correct structure at telomere termini. In addition, expression of mutant forms of TRF2 induced a growth arrest with characteristics of senescence. These results raise the possibility that chromosome end fusions and senescence in primary human cells may be caused by loss of TRF2 from shortened telomeres. Karlseder et al. (2002) reported that overexpression of TRF2 increased the rate of telomere shortening in primary cells without accelerating senescence. TRF2 reduced the senescence setpoint, defined as telomere

length at senescence, from 7 to 4 kb. TRF2 protected critically short telomeres from fusion and repressed chromosome-end fusions in presenescent cultures, which explained the ability of TRF2 to delay senescence. Thus, Karlseder et al. (2002) concluded that replicative senescence is induced by a change in the protected status of shortened telomeres rather than by a complete loss of telomeric DNA.

[56999] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[57000] van Steensel, B.; Smogorzewska, A.; de Lange, T. : TRF2 protects human telomeres from end-to-end fusions. *Cell* 92: 401–413, 1998. ; and

[57001] Karlseder, J.; Smogorzewska, A.; de Lange, T. : Senescence induced by altered telomere state, not telomere loss. *Science* 295: 2446–2449, 2002.

[57002] Further studies establishing the function and utilities of TERF2 are found in John Hopkins OMIM database record ID 602027, and in cited publications numbered 9496–6665, 9622–9623, 6666–666 and 7146 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.X-ray Repair Comple–

menting Defective Repair In Chinese Hamster Cells 3 (XRCC3, Accession NM\_005432) is another VGAM1689 host target gene. XRCC3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by XRCC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of XRCC3 BINDING SITE, designated SEQ ID:11909, to the nucleotide sequence of VGAM1689 RNA, herein designated VGAM RNA, also designated SEQ ID:4400.

[57003] Another function of VGAM1689 is therefore inhibition of X-ray Repair Complementing Defective Repair In Chinese Hamster Cells 3 (XRCC3, Accession NM\_005432), a gene which is required for meiotic recombination, synaptonemal complex formation and cell cycle progression. Accordingly, utilities of VGAM1689 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XRCC3. The function of XRCC3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1290. Chromosome 21 Open Reading Frame 4 (C21orf4, Accession NM\_006134)

is another VGAM1689 host target gene. C21orf4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by C21orf4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C21orf4 BINDING SITE, designated SEQ ID:12776, to the nucleotide sequence of VGAM1689 RNA, herein designated VGAM RNA, also designated SEQ ID:4400.

[57004] Another function of VGAM1689 is therefore inhibition of Chromosome 21 Open Reading Frame 4 (C21orf4, Accession NM\_006134). Accordingly, utilities of VGAM1689 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C21orf4. Di-Ras2 (Accession NM\_017594) is another VGAM1689 host target gene. Di-Ras2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by Di-Ras2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Di-Ras2 BINDING SITE, designated SEQ ID:19043, to the nucleotide sequence of VGAM1689 RNA, herein designated VGAM RNA, also designated SEQ

ID:4400.

[57005] Another function of VGAM1689 is therefore inhibition of Di-Ras2 (Accession NM\_017594). Accordingly, utilities of VGAM1689 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Di-Ras2. DKFZp761G2113 (Accession XM\_046017) is another VGAM1689 host target gene. DKFZp761G2113 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp761G2113, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761G2113 BINDING SITE, designated SEQ ID:34640, to the nucleotide sequence of VGAM1689 RNA, herein designated VGAM RNA, also designated SEQ ID:4400.

[57006] Another function of VGAM1689 is therefore inhibition of DKFZp761G2113 (Accession XM\_046017). Accordingly, utilities of VGAM1689 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761G2113. FLJ14251 (Accession NM\_024881) is another VGAM1689 host target gene. FLJ14251 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by FLJ14251, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14251 BINDING SITE, designated SEQ ID:24323, to the nucleotide sequence of VGAM1689 RNA, herein designated VGAM RNA, also designated SEQ ID:4400.

[57007] Another function of VGAM1689 is therefore inhibition of FLJ14251 (Accession NM\_024881). Accordingly, utilities of VGAM1689 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14251. Microtubule-associated Protein 1 Light Chain 3 Alpha (MAP1LC3A, Accession NM\_032514) is another VGAM1689 host target gene. MAP1LC3A BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MAP1LC3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP1LC3A BINDING SITE, designated SEQ ID:26265, to the nucleotide sequence of VGAM1689 RNA, herein designated VGAM RNA, also designated SEQ ID:4400.

[57008] Another function of VGAM1689 is therefore inhibition of

Microtubule-associated Protein 1 Light Chain 3 Alpha (MAP1LC3A, Accession NM\_032514). Accordingly, utilities of VGAM1689 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP1LC3A. RASD Family, Member 2 (RASD2, Accession NM\_014310) is another VGAM1689 host target gene. RASD2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RASD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RASD2 BINDING SITE, designated SEQ ID:15603, to the nucleotide sequence of VGAM1689 RNA, herein designated VGAM RNA, also designated SEQ ID:4400.

[57009] Another function of VGAM1689 is therefore inhibition of RASD Family, Member 2 (RASD2, Accession NM\_014310). Accordingly, utilities of VGAM1689 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASD2. Sialyltransferase 8C (alpha2,3Galbeta1,4GlcNAcalpha 2,8-sialyltransferase) (SIAT8C, Accession NM\_015879) is another VGAM1689 host target gene. SIAT8C BINDING SITE is HOST TARGET

binding site found in the 5' untranslated region of mRNA encoded by SIAT8C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIAT8C BINDING SITE, designated SEQ ID:18027, to the nucleotide sequence of VGAM1689 RNA, herein designated VGAM RNA, also designated SEQ ID:4400.

[57010] Another function of VGAM1689 is therefore inhibition of Sialyltransferase 8C (alpha2,3Galbeta1,4GlcNAcalpha 2,8-sialyltransferase) (SIAT8C, Accession NM\_015879). Accordingly, utilities of VGAM1689 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIAT8C. LOC124930 (Accession XM\_058867) is another VGAM1689 host target gene. LOC124930 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC124930, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124930 BINDING SITE, designated SEQ ID:36767, to the nucleotide sequence of VGAM1689 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4400.

[57011] Another function of VGAM1689 is therefore inhibition of LOC124930 (Accession XM\_058867). Accordingly, utilities of VGAM1689 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124930. LOC127534 (Accession XM\_060532) is another VGAM1689 host target gene. LOC127534 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC127534, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC127534 BINDING SITE, designated SEQ ID:37170, to the nucleotide sequence of VGAM1689 RNA, herein designated VGAM RNA, also designated SEQ ID:4400.

[57012] Another function of VGAM1689 is therefore inhibition of LOC127534 (Accession XM\_060532). Accordingly, utilities of VGAM1689 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC127534. LOC129566 (Accession XM\_065294) is another VGAM1689 host target gene. LOC129566 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC129566, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC129566 BINDING SITE, designated SEQ ID:37279, to the nucleotide sequence of VGAM1689 RNA, herein designated VGAM RNA, also designated SEQ ID:4400.

[57013] Another function of VGAM1689 is therefore inhibition of LOC129566 (Accession XM\_065294). Accordingly, utilities of VGAM1689 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC129566. LOC146957 (Accession XM\_085652) is another VGAM1689 host target gene. LOC146957 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146957, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146957 BINDING SITE, designated SEQ ID:38281, to the nucleotide sequence of VGAM1689 RNA, herein designated VGAM RNA, also designated SEQ ID:4400.

[57014] Another function of VGAM1689 is therefore inhibition of LOC146957 (Accession XM\_085652). Accordingly, utilities of VGAM1689 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC146957. LOC147136 (Accession XM\_085716) is another VGAM1689 host target gene. LOC147136 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC147136, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147136 BINDING SITE, designated SEQ ID:38301, to the nucleotide sequence of VGAM1689 RNA, herein designated VGAM RNA, also designated SEQ ID:4400.

[57015] Another function of VGAM1689 is therefore inhibition of LOC147136 (Accession XM\_085716). Accordingly, utilities of VGAM1689 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147136. LOC153480 (Accession XM\_053483) is another VGAM1689 host target gene. LOC153480 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC153480, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153480 BINDING SITE, designated SEQ ID:36089, to

the nucleotide sequence of VGAM1689 RNA, herein designated VGAM RNA, also designated SEQ ID:4400.

[57016] Another function of VGAM1689 is therefore inhibition of LOC153480 (Accession XM\_053483). Accordingly, utilities of VGAM1689 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153480. LOC161635 (Accession XM\_172921) is another VGAM1689 host target gene. LOC161635 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC161635, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC161635 BINDING SITE, designated SEQ ID:46187, to the nucleotide sequence of VGAM1689 RNA, herein designated VGAM RNA, also designated SEQ ID:4400.

[57017] Another function of VGAM1689 is therefore inhibition of LOC161635 (Accession XM\_172921). Accordingly, utilities of VGAM1689 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC161635. LOC222865 (Accession XM\_167242) is another VGAM1689 host target gene. LOC222865 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC222865, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222865 BINDING SITE, designated SEQ ID:44622, to the nucleotide sequence of VGAM1689 RNA, herein designated VGAM RNA, also designated SEQ ID:4400.

[57018] Another function of VGAM1689 is therefore inhibition of LOC222865 (Accession XM\_167242). Accordingly, utilities of VGAM1689 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222865. LOC253962 (Accession XM\_172968) is another VGAM1689 host target gene. LOC253962 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253962, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253962 BINDING SITE, designated SEQ ID:46225, to the nucleotide sequence of VGAM1689 RNA, herein designated VGAM RNA, also designated SEQ ID:4400.

[57019] Another function of VGAM1689 is therefore inhibition of LOC253962 (Accession XM\_172968). Accordingly, utilities

of VGAM1689 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253962. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1690 (VGAM1690) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[57020] VGAM1690 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1690 was detected is described hereinabove with reference to Figs. 1-8.

[57021] VGAM1690 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectocarpus Siliculosus Virus. VGAM1690 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[57022] VGAM1690 gene encodes a VGAM1690 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1690 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM1690 precursor RNA is designated SEQ ID:1676, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1676 is located at position 49102 relative to the genome of Ectocarpus Siliculosus Virus.

- [57023] VGAM1690 precursor RNA folds onto itself, forming VGAM1690 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [57024] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1690 folded precursor RNA into VGAM1690 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1690 RNA is designated SEQ ID:4401, and

is provided hereinbelow with reference to the sequence listing part.

[57025] VGAM1690 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1690 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1690 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[57026] VGAM1690 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1690 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1690 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM1690 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1690 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[57027] The complementary binding of VGAM1690 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1690 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1690 host target RNA into VGAM1690 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[57028] It is appreciated that VGAM1690 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1690 host target genes. The mRNA of each one of this plurality of VGAM1690 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com–

plementary to VGAM1690 RNA, herein designated VGAM RNA, and which when bound by VGAM1690 RNA causes inhibition of translation of respective one or more VGAM1690 host target proteins.

[57029] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1690 gene, herein designated VGAM GENE, on one or more VGAM1690 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[57030] It is yet further appreciated that a function of VGAM1690 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1690 include diagnosis, prevention and treatment of viral infection by Ectocarpus Siliculosus Virus. Specific functions, and accordingly utilities, of VGAM1690 correlate with, and may be deduced from, the identity of the host target genes which VGAM1690 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[57031] Nucleotide sequences of the VGAM1690 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1690 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1690 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1690 are further described hereinbelow with reference to Table 1.

[57032] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1690 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1690 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[57033] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM1690 gene, herein designated VGAM is inhibition of expression of VGAM1690 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1690 correlate with, and may be deduced from, the identity of the target genes which VGAM1690 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[57034] Myosin, Heavy Polypeptide 11, Smooth Muscle (MYH11, Accession NM\_002474) is a VGAM1690 host target gene. MYH11 BINDING SITE1 and MYH11 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MYH11, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYH11 BINDING SITE1 and MYH11 BINDING SITE2, designated SEQ ID:8299 and SEQ ID:23141 respectively, to the nucleotide sequence of VGAM1690 RNA, herein designated VGAM RNA, also designated SEQ ID:4401.

[57035] A function of VGAM1690 is therefore inhibition of Myosin, Heavy Polypeptide 11, Smooth Muscle (MYH11, Accession NM\_002474), a gene which is involved in muscle contraction. Accordingly, utilities of VGAM1690 include diagno-

sis, prevention and treatment of diseases and clinical conditions associated with MYH11. The function of MYH11 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM178. PANK (Accession NM\_138316) is another VGAM1690 host target gene. PANK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PANK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PANK BINDING SITE, designated SEQ ID:28713, to the nucleotide sequence of VGAM1690 RNA, herein designated VGAM RNA, also designated SEQ ID:4401.

[57036] Another function of VGAM1690 is therefore inhibition of PANK (Accession NM\_138316). Accordingly, utilities of VGAM1690 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PANK. LOC126755 (Accession XM\_059074) is another VGAM1690 host target gene. LOC126755 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC126755, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126755 BINDING SITE, designated SEQ ID:36859, to the nucleotide sequence of VGAM1690 RNA, herein designated VGAM RNA, also designated SEQ ID:4401.

[57037] Another function of VGAM1690 is therefore inhibition of LOC126755 (Accession XM\_059074). Accordingly, utilities of VGAM1690 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126755. LOC164382 (Accession XM\_104390) is another VGAM1690 host target gene. LOC164382 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC164382, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC164382 BINDING SITE, designated SEQ ID:42166, to the nucleotide sequence of VGAM1690 RNA, herein designated VGAM RNA, also designated SEQ ID:4401.

[57038] Another function of VGAM1690 is therefore inhibition of LOC164382 (Accession XM\_104390). Accordingly, utilities of VGAM1690 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC164382. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1691 (VGAM1691) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[57039] VGAM1691 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1691 was detected is described hereinabove with reference to Figs. 1–8.

[57040] VGAM1691 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectocarpus Siliculosus Virus. VGAM1691 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[57041] VGAM1691 gene encodes a VGAM1691 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1691 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1691 precursor RNA is designated SEQ ID:1677, and is provided hereinbelow with ref–

erence to the sequence listing part. Nucleotide sequence SEQ ID:1677 is located at position 46991 relative to the genome of Ectocarpus Siliculosus Virus.

- [57042] VGAM1691 precursor RNA folds onto itself, forming VGAM1691 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [57043] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1691 folded precursor RNA into VGAM1691 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1691 RNA is designated SEQ ID:4402, and is provided hereinbelow with reference to the sequence listing part.

[57044] VGAM1691 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1691 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1691 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[57045] VGAM1691 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1691 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1691 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1691 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM1691 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[57046] The complementary binding of VGAM1691 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1691 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1691 host target RNA into VGAM1691 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[57047] It is appreciated that VGAM1691 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1691 host target genes. The mRNA of each one of this plurality of VGAM1691 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1691 RNA, herein designated VGAM RNA, and which when bound by VGAM1691 RNA causes

inhibition of translation of respective one or more VGAM1691 host target proteins.

[57048] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1691 gene, herein designated VGAM GENE, on one or more VGAM1691 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[57049] It is yet further appreciated that a function of VGAM1691 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1691 include diagnosis, prevention and

treatment of viral infection by Ectocarpus Siliculosus Virus. Specific functions, and accordingly utilities, of VGAM1691 correlate with, and may be deduced from, the identity of the host target genes which VGAM1691 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[57050] Nucleotide sequences of the VGAM1691 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1691 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1691 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1691 are further described hereinbelow with reference to Table 1.

[57051] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1691 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1691 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[57052] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1691 gene, herein designated VGAM is inhibition of expression of VGAM1691 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM1691 correlate with, and may be deduced from, the identity of the target genes which VGAM1691 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[57053] ABH (Accession XM\_007409) is a VGAM1691 host target gene. ABH BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ABH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABH BINDING SITE, designated SEQ ID:30053, to the nucleotide sequence of VGAM1691 RNA, herein designated VGAM RNA, also designated SEQ ID:4402.

[57054] A function of VGAM1691 is therefore inhibition of ABH (Accession XM\_007409). Accordingly, utilities of VGAM1691 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABH. CD244 (Accession NM\_016382) is another VGAM1691 host target gene. CD244 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CD244, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CD244 BINDING SITE, designated SEQ ID:18523, to the nucleotide sequence of VGAM1691 RNA, herein designated VGAM RNA, also designated SEQ ID:4402.

[57055] Another function of VGAM1691 is therefore inhibition of CD244 (Accession NM\_016382), a gene which can interfere with a step as proximal as phosphorylation of an activation receptor. Accordingly, utilities of VGAM1691 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD244. The function of CD244 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1224. Cleavage and Polyadenylation Specific Factor 4, 30kDa (CPSF4, Accession NM\_006693) is another VGAM1691 host target gene. CPSF4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CPSF4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CPSF4 BINDING SITE, designated SEQ ID:13513, to the nucleotide sequence of

VGAM1691 RNA, herein designated VGAM RNA, also designated SEQ ID:4402.

[57056] Another function of VGAM1691 is therefore inhibition of Cleavage and Polyadenylation Specific Factor 4, 30kDa (CPSF4, Accession NM\_006693), a gene which may bind DNA. Accordingly, utilities of VGAM1691 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPSF4. The function of CPSF4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM998. IL2-inducible T-cell Kinase (ITK, Accession NM\_005546) is another VGAM1691 host target gene. ITK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITK BINDING SITE, designated SEQ ID:12074, to the nucleotide sequence of VGAM1691 RNA, herein designated VGAM RNA, also designated SEQ ID:4402.

[57057] Another function of VGAM1691 is therefore inhibition of IL2-inducible T-cell Kinase (ITK, Accession NM\_005546), a

gene which plays a role in t cell proliferation and differentiation. Accordingly, utilities of VGAM1691 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITK. The function of ITK and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM288. Calsyntenin 2 (CLSTN2, Accession NM\_022131) is another VGAM1691 host target gene. CLSTN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLSTN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLSTN2 BINDING SITE, designated SEQ ID:22692, to the nucleotide sequence of VGAM1691 RNA, herein designated VGAM RNA, also designated SEQ ID:4402.

[57058] Another function of VGAM1691 is therefore inhibition of Calsyntenin 2 (CLSTN2, Accession NM\_022131). Accordingly, utilities of VGAM1691 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLSTN2. CMG2 (Accession NM\_058172) is another VGAM1691 host target gene. CMG2 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CMG2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CMG2 BINDING SITE, designated SEQ ID:27717, to the nucleotide sequence of VGAM1691 RNA, herein designated VGAM RNA, also designated SEQ ID:4402.

[57059] Another function of VGAM1691 is therefore inhibition of CMG2 (Accession NM\_058172). Accordingly, utilities of VGAM1691 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CMG2. FLJ23186 (Accession XM\_017088) is another VGAM1691 host target gene. FLJ23186 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23186, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23186 BINDING SITE, designated SEQ ID:30296, to the nucleotide sequence of VGAM1691 RNA, herein designated VGAM RNA, also designated SEQ ID:4402.

[57060] Another function of VGAM1691 is therefore inhibition of

FLJ23186 (Accession XM\_017088). Accordingly, utilities of VGAM1691 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23186. KIAA0367 (Accession XM\_041018) is another VGAM1691 host target gene. KIAA0367 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0367, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0367 BINDING SITE, designated SEQ ID:33416, to the nucleotide sequence of VGAM1691 RNA, herein designated VGAM RNA, also designated SEQ ID:4402.

[57061] Another function of VGAM1691 is therefore inhibition of KIAA0367 (Accession XM\_041018). Accordingly, utilities of VGAM1691 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0367. Solute Carrier Family 21 (organic anion transporter), Member 14 (SLC21A14, Accession NM\_017435) is another VGAM1691 host target gene. SLC21A14 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC21A14, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC21A14 BINDING SITE, designated SEQ ID:18890, to the nucleotide sequence of VGAM1691 RNA, herein designated VGAM RNA, also designated SEQ ID:4402.

[57062] Another function of VGAM1691 is therefore inhibition of Solute Carrier Family 21 (organic anion transporter), Member 14 (SLC21A14, Accession NM\_017435). Accordingly, utilities of VGAM1691 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC21A14. LOC116411 (Accession XM\_058095) is another VGAM1691 host target gene. LOC116411 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC116411, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC116411 BINDING SITE, designated SEQ ID:36573, to the nucleotide sequence of VGAM1691 RNA, herein designated VGAM RNA, also designated SEQ ID:4402.

[57063] Another function of VGAM1691 is therefore inhibition of LOC116411 (Accession XM\_058095). Accordingly, utilities

of VGAM1691 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116411. LOC157349 (Accession XM\_088298) is another VGAM1691 host target gene. LOC157349 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157349, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157349 BINDING SITE, designated SEQ ID:39587, to the nucleotide sequence of VGAM1691 RNA, herein designated VGAM RNA, also designated SEQ ID:4402.

[57064] Another function of VGAM1691 is therefore inhibition of LOC157349 (Accession XM\_088298). Accordingly, utilities of VGAM1691 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157349. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1692 (VGAM1692) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[57065] VGAM1692 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1692 was detected is described hereinabove with reference to Figs. 1–8.

[57066] VGAM1692 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectocarpus Siliculosus Virus. VGAM1692 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[57067] VGAM1692 gene encodes a VGAM1692 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1692 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1692 precursor RNA is designated SEQ ID:1678, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1678 is located at position 52063 relative to the genome of Ectocarpus Siliculosus Virus.

[57068] VGAM1692 precursor RNA folds onto itself, forming VGAM1692 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[57069] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1692 folded precursor RNA into VGAM1692 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM1692 RNA is designated SEQ ID:4403, and is provided hereinbelow with reference to the sequence listing part.

[57070] VGAM1692 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1692 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1692 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[57071] VGAM1692 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1692 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1692 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1692 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1692 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[57072] The complementary binding of VGAM1692 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1692 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1692 host target RNA into VGAM1692 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[57073] It is appreciated that VGAM1692 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1692 host target genes. The mRNA of each one of this plurality of VGAM1692 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1692 RNA, herein designated VGAM RNA, and which when bound by VGAM1692 RNA causes inhibition of translation of respective one or more VGAM1692 host target proteins.

[57074] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1692 gene, herein designated VGAM GENE, on one or more VGAM1692 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[57075] It is yet further appreciated that a function of VGAM1692 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1692 include diagnosis, prevention and treatment of viral infection by Ectocarpus Siliculosus Virus. Specific functions, and accordingly utilities, of VGAM1692 correlate with, and may be deduced from, the identity of the host target genes which VGAM1692 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[57076] Nucleotide sequences of the VGAM1692 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the  
`diced` VGAM1692 RNA, herein designated VGAM RNA,  
and a schematic representation of the secondary folding  
of VGAM1692 folded precursor RNA, herein designated  
VGAM FOLDED PRECURSOR RNA, of VGAM1692 are further  
described hereinbelow with reference to Table 1.

[57077] Nucleotide sequences of host target binding sites, such as  
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of  
Fig. 1, found on VGAM1692 host target RNA, and  
schematic representation of the complementarity of each  
of these host target binding sites to VGAM1692 RNA,  
herein designated VGAM RNA, are described hereinbelow  
with reference to Table 2.

[57078] As mentioned hereinabove with reference to Fig. 1, a  
function of VGAM1692 gene, herein designated VGAM is  
inhibition of expression of VGAM1692 target genes. It is  
appreciated that specific functions, and accordingly utili-  
ties, of VGAM1692 correlate with, and may be deduced  
from, the identity of the target genes which VGAM1692  
binds and inhibits, and the function of these target genes,  
as elaborated hereinbelow.

[57079] Protein Kinase C, Nu (PRKCN, Accession NM\_005813) is a  
VGAM1692 host target gene. PRKCN BINDING SITE is HOST

TARGET binding site found in the 3' untranslated region of mRNA encoded by PRKCN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRKCN BINDING SITE, designated SEQ ID:12400, to the nucleotide sequence of VGAM1692 RNA, herein designated VGAM RNA, also designated SEQ ID:4403.

[57080] A function of VGAM1692 is therefore inhibition of Protein Kinase C,  $\alpha$  (PRKCN, Accession NM\_005813). Accordingly, utilities of VGAM1692 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKCN. WAS Protein Family, Member 3 (WASF3, Accession NM\_006646) is another VGAM1692 host target gene. WASF3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by WASF3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WASF3 BINDING SITE, designated SEQ ID:13443, to the nucleotide sequence of VGAM1692 RNA, herein designated VGAM RNA, also designated SEQ ID:4403.

[57081] Another function of VGAM1692 is therefore inhibition of WAS Protein Family, Member 3 (WASF3, Accession NM\_006646), a gene which stimulates actin polymerization. Accordingly, utilities of VGAM1692 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WASF3. The function of WASF3 has been established by previous studies. The actin cytoskeleton plays critical roles in cell morphologic changes and

motility. Rho family small GTPases such as Rho (see OMIM Ref. No. 165370), RAC (see OMIM Ref. No. 602048), and CDC42 (OMIM Ref. No. 116952) organize the actin cytoskeleton. Other major players in actin-based motility are the 7 members of the ARP2/3 complex (see OMIM Ref. No. 604221). The Wiskott–Aldrich syndrome protein (WASP; 301000) and WASP-like (WASL; 605056) are among the downstream effector molecules involved in the transmission of signals from tyrosine kinase receptors and small GTPases to the actin cytoskeleton. WASF1 (OMIM Ref. No. 605035) is also involved in actin reorganization, but its expression is restricted to brain. By searching an EST database for homologs of WASF1 and by screening cDNA libraries, Suetsugu et al. (1999) identified WASF2 (OMIM Ref. No. 605068) and WASF3, which they termed WAVE2 and WAVE3, respectively. The predicted 502-amino acid WASF3 protein shares 48% amino acid identity with WASF1. Northern blot analysis revealed that, like WASF1, WASF3 expression is strongest in brain, although weak expression was detected in kidney and liver. SDS-PAGE analysis showed that, like other WASP family members, WASF3 binds actin through its C-terminal verprolin homology (VPH) domain. Immunofluorescence mi-

croscopy demonstrated that ectopically expressed WASF3 induces abnormal actin clusters. These actin cluster formations were suppressed by deletion of the VPH domain of WASF3.

[57082] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[57083] Nagase, T.; Ishikawa, K.; Suyama, M.; Kikuno, R.; Hiro-sawa, M.; Miyajima, N.; Tanaka, A.; Kotani, H.; Nomura, N.; Ohara, O. : Prediction of the coding sequences of unidentified human genes. XII. The complete sequences of 100 new cDNA clones from brain which code for large proteins in vitro. DNA Res. 5: 355–364, 1998. ; and

[57084] Suetsugu, S.; Miki, H.; Takenawa, T. : Identification of two human WAVE/SCAR homologues as general actin regulatory molecules which associate with the Arp2/3 complex. Biochem. Biophys.

[57085] Further studies establishing the function and utilities of WASF3 are found in John Hopkins OMIM database record ID 605068, and in cited publications numbered 493 and 6593 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Calcium/calmodulin-dependent Protein Kinase Ki-

nase 1, Alpha (CAMKK1, Accession NM\_032294) is another VGAM1692 host target gene. CAMKK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAMKK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAMKK1 BINDING SITE, designated SEQ ID:26063, to the nucleotide sequence of VGAM1692 RNA, herein designated VGAM RNA, also designated SEQ ID:4403.

[57086] Another function of VGAM1692 is therefore inhibition of Calcium/calmodulin-dependent Protein Kinase Kinase 1, Alpha (CAMKK1, Accession NM\_032294). Accordingly, utilities of VGAM1692 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAMKK1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1693 (VGAM1693) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[57087] VGAM1693 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1693 was detected is described hereinabove with reference to Figs. 1–8.

[57088] VGAM1693 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectocarpus Siliculosus Virus. VGAM1693 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[57089] VGAM1693 gene encodes a VGAM1693 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1693 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1693 precursor RNA is designated SEQ ID:1679, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1679 is located at position 54673 relative to the genome of Ectocarpus Siliculosus Virus.

[57090] VGAM1693 precursor RNA folds onto itself, forming VGAM1693 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[57091] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1693 folded precursor RNA into VGAM1693 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1693 RNA is designated SEQ ID:4404, and is provided hereinbelow with reference to the sequence listing part.

[57092] VGAM1693 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1693 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1693 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[57093] VGAM1693 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1693 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1693 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1693 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1693 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[57094] The complementary binding of VGAM1693 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1693 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1693 host target RNA into VGAM1693 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[57095] It is appreciated that VGAM1693 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1693 host target genes. The mRNA of each one of this plurality of VGAM1693 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1693 RNA, herein designated VGAM RNA, and which when bound by VGAM1693 RNA causes inhibition of translation of respective one or more VGAM1693 host target proteins.

[57096] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1693 gene, herein designated VGAM GENE, on one or more VGAM1693 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[57097] It is yet further appreciated that a function of VGAM1693 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1693 include diagnosis, prevention and treatment of viral infection by Ectocarpus Siliculosus Virus. Specific functions, and accordingly utilities, of VGAM1693 correlate with, and may be deduced from, the identity of the host target genes which VGAM1693 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[57098] Nucleotide sequences of the VGAM1693 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM1693 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1693 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1693 are further described hereinbelow with reference to Table 1.

[57099] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1693 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1693 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[57100] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1693 gene, herein designated VGAM is inhibition of expression of VGAM1693 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1693 correlate with, and may be deduced from, the identity of the target genes which VGAM1693 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[57101] Inositol Polyphosphate-5-phosphatase, 145kDa (INPP5D, Accession XM\_096169) is a VGAM1693 host target gene. INPP5D BINDING SITE is HOST TARGET binding site found

in the 3' untranslated region of mRNA encoded by INPP5D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of INPP5D BINDING SITE, designated SEQ ID:40302, to the nucleotide sequence of VGAM1693 RNA, herein designated VGAM RNA, also designated SEQ ID:4404.

[57102] A function of VGAM1693 is therefore inhibition of Inositol Polyphosphate-5-phosphatase, 145kDa (INPP5D, Accession XM\_096169), a gene which hydrolyzes Ins(1,3,4,5)P<sub>4</sub> and PtdIns(3,4,5)P<sub>3</sub>; contains an SH2-domain. Accordingly, utilities of VGAM1693 include diagnosis, prevention and treatment of diseases and clinical conditions associated with INPP5D. The function of INPP5D and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM64. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1694 (VGAM1694) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host

target genes is known in the art.

[57103] VGAM1694 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1694 was detected is described hereinabove with reference to Figs. 1–8.

[57104] VGAM1694 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectocarpus Siliculosus Virus. VGAM1694 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[57105] VGAM1694 gene encodes a VGAM1694 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1694 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1694 precursor RNA is designated SEQ ID:1680, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1680 is located at position 50970 relative to the genome of Ectocarpus Siliculosus Virus.

[57106] VGAM1694 precursor RNA folds onto itself, forming VGAM1694 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two–

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[57107] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1694 folded precursor RNA into VGAM1694 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1694 RNA is designated SEQ ID:4405, and is provided hereinbelow with reference to the sequence listing part.

[57108] VGAM1694 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1694 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1694 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[57109] VGAM1694 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1694 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1694 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1694 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1694 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[57110] The complementary binding of VGAM1694 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1694 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1694 host target RNA into VGAM1694 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[57111] It is appreciated that VGAM1694 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1694 host target genes. The mRNA of each one of this plurality of VGAM1694 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1694 RNA, herein designated VGAM RNA, and which when bound by VGAM1694 RNA causes inhibition of translation of respective one or more VGAM1694 host target proteins.

[57112] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1694 gene, herein designated VGAM GENE, on one

or more VGAM1694 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[57113] It is yet further appreciated that a function of VGAM1694 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1694 include diagnosis, prevention and treatment of viral infection by Ectocarpus Siliculosus Virus. Specific functions, and accordingly utilities, of VGAM1694 correlate with, and may be deduced from, the identity of the host target genes which VGAM1694 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[57114] Nucleotide sequences of the VGAM1694 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1694 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1694 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1694 are further described hereinbelow with reference to Table 1.

[57115] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1694 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1694 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[57116] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1694 gene, herein designated VGAM is inhibition of expression of VGAM1694 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1694 correlate with, and may be deduced from, the identity of the target genes which VGAM1694 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[57117] Inositol Polyphosphate-5-phosphatase, 145kDa (INPP5D,

Accession XM\_096169) is a VGAM1694 host target gene. INPP5D BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by INPP5D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of INPP5D BINDING SITE, designated SEQ ID:40302, to the nucleotide sequence of VGAM1694 RNA, herein designated VGAM RNA, also designated SEQ ID:4405.

[57118] A function of VGAM1694 is therefore inhibition of Inositol Polyphosphate-5-phosphatase, 145kDa (INPP5D, Accession XM\_096169), a gene which hydrolyzes Ins(1,3,4,5)P<sub>4</sub> and PtdIns(3,4,5)P<sub>3</sub>; contains an SH2-domain. Accordingly, utilities of VGAM1694 include diagnosis, prevention and treatment of diseases and clinical conditions associated with INPP5D. The function of INPP5D and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM64. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1695 (VGAM1695)

viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[57119] VGAM1695 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1695 was detected is described hereinabove with reference to Figs. 1–8.

[57120] VGAM1695 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectocarpus Siliculosus Virus. VGAM1695 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[57121] VGAM1695 gene encodes a VGAM1695 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1695 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1695 precursor RNA is designated SEQ ID:1681, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1681 is located at position 51375 relative to the genome of Ectocarpus Siliculosus Virus.

[57122] VGAM1695 precursor RNA folds onto itself, forming

VGAM1695 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[57123] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1695 folded precursor RNA into VGAM1695 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1695 RNA is designated SEQ ID:4406, and is provided hereinbelow with reference to the sequence listing part.

[57124] VGAM1695 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1695 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1695 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[57125] VGAM1695 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1695 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1695 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1695 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1695 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[57126] The complementary binding of VGAM1695 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1695 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1695 host target RNA into VGAM1695 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[57127] It is appreciated that VGAM1695 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1695 host target genes. The mRNA of each one of this plurality of VGAM1695 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1695 RNA, herein designated VGAM RNA, and which when bound by VGAM1695 RNA causes inhibition of translation of respective one or more VGAM1695 host target proteins.

[57128] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1695 gene, herein designated VGAM GENE, on one or more VGAM1695 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[57129] It is yet further appreciated that a function of VGAM1695 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1695 include diagnosis, prevention and treatment of viral infection by Ectocarpus Siliculosus Virus. Specific functions, and accordingly utilities, of VGAM1695 correlate with, and may be deduced from, the identity of the host target genes which VGAM1695 binds

and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[57130] Nucleotide sequences of the VGAM1695 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1695 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1695 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1695 are further described hereinbelow with reference to Table 1.

[57131] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1695 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1695 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[57132] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1695 gene, herein designated VGAM is inhibition of expression of VGAM1695 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1695 correlate with, and may be deduced from, the identity of the target genes which VGAM1695 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[57133] Inositol Polyphosphate-5-phosphatase, 145kDa (INPP5D, Accession XM\_096169) is a VGAM1695 host target gene. INPP5D BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by INPP5D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of INPP5D BINDING SITE, designated SEQ ID:40302, to the nucleotide sequence of VGAM1695 RNA, herein designated VGAM RNA, also designated SEQ ID:4406.

[57134] A function of VGAM1695 is therefore inhibition of Inositol Polyphosphate-5-phosphatase, 145kDa (INPP5D, Accession XM\_096169), a gene which hydrolyzes Ins(1,3,4,5)P<sub>4</sub> and PtdIns(3,4,5)P<sub>3</sub>; contains an SH2-domain. Accordingly, utilities of VGAM1695 include diagnosis, prevention and treatment of diseases and clinical conditions associated with INPP5D. The function of INPP5D and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM64. Fig. 1 further provides a conceptual description of a novel bioinformatically de-

tected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1696 (VGAM1696) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[57135] VGAM1696 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1696 was detected is described hereinabove with reference to Figs. 1–8.

[57136] VGAM1696 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectocarpus Siliculosus Virus. VGAM1696 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[57137] VGAM1696 gene encodes a VGAM1696 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1696 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1696 precursor RNA is designated SEQ ID:1682, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1682 is located at position 52738 relative to the

genome of Ectocarpus Siliculosus Virus.

[57138] VGAM1696 precursor RNA folds onto itself, forming VGAM1696 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[57139] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1696 folded precursor RNA into VGAM1696 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1696 RNA is designated SEQ ID:4407, and is provided hereinbelow with reference to the sequence listing part.

[57140] VGAM1696 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1696 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1696 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[57141] VGAM1696 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1696 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1696 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1696 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1696 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[57142] The complementary binding of VGAM1696 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1696 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1696 host target RNA into VGAM1696 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[57143] It is appreciated that VGAM1696 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1696 host target genes. The mRNA of each one of this plurality of VGAM1696 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1696 RNA, herein designated VGAM RNA, and which when bound by VGAM1696 RNA causes inhibition of translation of respective one or more VGAM1696 host target proteins.

[57144] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1696 gene, herein designated VGAM GENE, on one or more VGAM1696 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[57145] It is yet further appreciated that a function of VGAM1696 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1696 include diagnosis, prevention and treatment of viral infection by Ectocarpus Siliculosus Virus. Specific functions, and accordingly utilities, of

VGAM1696 correlate with, and may be deduced from, the identity of the host target genes which VGAM1696 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[57146] Nucleotide sequences of the VGAM1696 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1696 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1696 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1696 are further described hereinbelow with reference to Table 1.

[57147] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1696 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1696 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[57148] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1696 gene, herein designated VGAM is inhibition of expression of VGAM1696 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1696 correlate with, and may be deduced

from, the identity of the target genes which VGAM1696 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[57149] 5-hydroxytryptamine (serotonin) Receptor 2C (HTR2C, Accession NM\_000868) is a VGAM1696 host target gene. HTR2C BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HTR2C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HTR2C BINDING SITE, designated SEQ ID:6534, to the nucleotide sequence of VGAM1696 RNA, herein designated VGAM RNA, also designated SEQ ID:4407.

[57150] A function of VGAM1696 is therefore inhibition of 5-hydroxytryptamine (serotonin) Receptor 2C (HTR2C, Accession NM\_000868), a gene which activates phospholipase C and regulates intracellular calcium flux. Accordingly, utilities of VGAM1696 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTR2C. The function of HTR2C and its association with various diseases and clinical conditions, has been established by previous studies, as described here-

inabove with reference to VGAM1052.Inositol

1,4,5-triphosphate Receptor, Type 3 (ITPR3, Accession NM\_002224) is another VGAM1696 host target gene.

ITPR3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ITPR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITPR3 BINDING SITE, designated SEQ ID:7998, to the nucleotide sequence of VGAM1696 RNA, herein designated VGAM RNA, also designated SEQ ID:4407.

[57151] Another function of VGAM1696 is therefore inhibition of Inositol 1,4,5-triphosphate Receptor, Type 3 (ITPR3, Accession NM\_002224), a gene which may be responsible for calcium release from intracellular stores. Accordingly, utilities of VGAM1696 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITPR3. The function of ITPR3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM310.Calcium/calmodulin-dependent Protein Kinase Kinase 1, Alpha (CAMKK1, Accession NM\_032294) is another VGAM1696 host target gene.

CAMKK1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CAMKK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAMKK1 BINDING SITE, designated SEQ ID:26067, to the nucleotide sequence of VGAM1696 RNA, herein designated VGAM RNA, also designated SEQ ID:4407.

[57152] Another function of VGAM1696 is therefore inhibition of Calcium/calmodulin-dependent Protein Kinase Kinase 1, Alpha (CAMKK1, Accession NM\_032294). Accordingly, utilities of VGAM1696 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAMKK1. FLJ21432 (Accession NM\_024551) is another VGAM1696 host target gene. FLJ21432 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ21432, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21432 BINDING SITE, designated SEQ ID:23769, to the nucleotide sequence of VGAM1696 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4407.

[57153] Another function of VGAM1696 is therefore inhibition of FLJ21432 (Accession NM\_024551). Accordingly, utilities of VGAM1696 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21432. LGP1 (Accession NM\_032484) is another VGAM1696 host target gene. LGP1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LGP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LGP1 BINDING SITE, designated SEQ ID:26231, to the nucleotide sequence of VGAM1696 RNA, herein designated VGAM RNA, also designated SEQ ID:4407.

[57154] Another function of VGAM1696 is therefore inhibition of LGP1 (Accession NM\_032484). Accordingly, utilities of VGAM1696 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LGP1. Mitogen-activated Protein Kinase Kinase 4 (MAP2K4, Accession NM\_003010) is another VGAM1696 host target gene. MAP2K4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

MAP2K4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP2K4 BINDING SITE, designated SEQ ID:8918, to the nucleotide sequence of VGAM1696 RNA, herein designated VGAM RNA, also designated SEQ ID:4407.

[57155] Another function of VGAM1696 is therefore inhibition of Mitogen-activated Protein Kinase Kinase 4 (MAP2K4, Accession NM\_003010). Accordingly, utilities of VGAM1696 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP2K4. MGC14161 (Accession NM\_032892) is another VGAM1696 host target gene. MGC14161 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC14161, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC14161 BINDING SITE, designated SEQ ID:26718, to the nucleotide sequence of VGAM1696 RNA, herein designated VGAM RNA, also designated SEQ ID:4407.

[57156] Another function of VGAM1696 is therefore inhibition of

MGC14161 (Accession NM\_032892). Accordingly, utilities of VGAM1696 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC14161. LOC115330 (Accession NM\_138445) is another VGAM1696 host target gene. LOC115330 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC115330, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115330 BINDING SITE, designated SEQ ID:28810, to the nucleotide sequence of VGAM1696 RNA, herein designated VGAM RNA, also designated SEQ ID:4407.

[57157] Another function of VGAM1696 is therefore inhibition of LOC115330 (Accession NM\_138445). Accordingly, utilities of VGAM1696 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115330. LOC116437 (Accession XM\_058185) is another VGAM1696 host target gene. LOC116437 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC116437, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC116437 BINDING SITE, designated SEQ ID:36581, to the nucleotide sequence of VGAM1696 RNA, herein designated VGAM RNA, also designated SEQ ID:4407.

[57158] Another function of VGAM1696 is therefore inhibition of LOC116437 (Accession XM\_058185). Accordingly, utilities of VGAM1696 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116437. LOC131873 (Accession XM\_067585) is another VGAM1696 host target gene. LOC131873 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC131873, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC131873 BINDING SITE, designated SEQ ID:37366, to the nucleotide sequence of VGAM1696 RNA, herein designated VGAM RNA, also designated SEQ ID:4407.

[57159] Another function of VGAM1696 is therefore inhibition of LOC131873 (Accession XM\_067585). Accordingly, utilities of VGAM1696 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC131873. LOC58489 (Accession XM\_051862) is an-

other VGAM1696 host target gene. LOC58489 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC58489, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC58489 BINDING SITE, designated SEQ ID:35907, to the nucleotide sequence of VGAM1696 RNA, herein designated VGAM RNA, also designated SEQ ID:4407.

[57160] Another function of VGAM1696 is therefore inhibition of LOC58489 (Accession XM\_051862). Accordingly, utilities of VGAM1696 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC58489. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1697 (VGAM1697) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[57161] VGAM1697 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1697 was detected is de-

scribed hereinabove with reference to Figs. 1–8.

[57162] VGAM1697 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectocarpus Siliculosus Virus. VGAM1697 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[57163] VGAM1697 gene encodes a VGAM1697 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1697 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1697 precursor RNA is designated SEQ ID:1683, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1683 is located at position 50957 relative to the genome of Ectocarpus Siliculosus Virus.

[57164] VGAM1697 precursor RNA folds onto itself, forming VGAM1697 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[57165] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1697 folded precursor RNA into VGAM1697 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1697 RNA is designated SEQ ID:4408, and is provided hereinbelow with reference to the sequence listing part.

[57166] VGAM1697 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1697 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1697 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[57167] VGAM1697 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1697 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1697 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1697 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1697 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[57168] The complementary binding of VGAM1697 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1697 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1697 host target RNA into VGAM1697 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[57169] It is appreciated that VGAM1697 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1697 host target genes. The mRNA of each one of this plurality of VGAM1697 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1697 RNA, herein designated VGAM RNA, and which when bound by VGAM1697 RNA causes inhibition of translation of respective one or more VGAM1697 host target proteins.

[57170] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1697 gene, herein designated VGAM GENE, on one or more VGAM1697 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[57171] It is yet further appreciated that a function of VGAM1697 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1697 include diagnosis, prevention and treatment of viral infection by Ectocarpus Siliculosus Virus. Specific functions, and accordingly utilities, of VGAM1697 correlate with, and may be deduced from, the identity of the host target genes which VGAM1697 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[57172] Nucleotide sequences of the VGAM1697 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1697 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM1697 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1697 are further described hereinbelow with reference to Table 1.

[57173] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1697 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1697 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[57174] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1697 gene, herein designated VGAM is inhibition of expression of VGAM1697 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1697 correlate with, and may be deduced from, the identity of the target genes which VGAM1697 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[57175] Inositol Polyphosphate-5-phosphatase, 145kDa (INPP5D, Accession XM\_096169) is a VGAM1697 host target gene. INPP5D BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by INPP5D, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of INPP5D BINDING SITE, designated SEQ ID:40302, to the nucleotide sequence of VGAM1697 RNA, herein designated VGAM RNA, also designated SEQ ID:4408.

[57176] A function of VGAM1697 is therefore inhibition of Inositol Polyphosphate-5-phosphatase, 145kDa (INPP5D, Accession XM\_096169), a gene which hydrolyzes Ins(1,3,4,5)P<sub>4</sub> and PtdIns(3,4,5)P<sub>3</sub>; contains an SH2-domain. Accordingly, utilities of VGAM1697 include diagnosis, prevention and treatment of diseases and clinical conditions associated with INPP5D. The function of INPP5D and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM64. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1698 (VGAM1698) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[57177] VGAM1698 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1698 was detected is described hereinabove with reference to Figs. 1–8.

[57178] VGAM1698 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectocarpus Siliculosus Virus. VGAM1698 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[57179] VGAM1698 gene encodes a VGAM1698 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1698 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1698 precursor RNA is designated SEQ ID:1684, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1684 is located at position 52499 relative to the genome of Ectocarpus Siliculosus Virus.

[57180] VGAM1698 precursor RNA folds onto itself, forming VGAM1698 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[57181] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1698 folded precursor RNA into VGAM1698 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1698 RNA is designated SEQ ID:4409, and is provided hereinbelow with reference to the sequence listing part.

[57182] VGAM1698 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1698 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1698 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[57183] VGAM1698 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1698 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1698 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1698 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1698 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[57184] The complementary binding of VGAM1698 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1698 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1698 host target RNA into VGAM1698 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[57185] It is appreciated that VGAM1698 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1698 host target genes. The mRNA of each one of this plurality of VGAM1698 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1698 RNA, herein designated VGAM RNA, and which when bound by VGAM1698 RNA causes inhibition of translation of respective one or more VGAM1698 host target proteins.

[57186] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1698 gene, herein designated VGAM GENE, on one or more VGAM1698 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[57187] It is yet further appreciated that a function of VGAM1698 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1698 include diagnosis, prevention and treatment of viral infection by Ectocarpus Siliculosus Virus. Specific functions, and accordingly utilities, of VGAM1698 correlate with, and may be deduced from, the identity of the host target genes which VGAM1698 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[57188] Nucleotide sequences of the VGAM1698 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM1698 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1698 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1698 are further described hereinbelow with reference to Table 1.

[57189] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1698 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1698 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[57190] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1698 gene, herein designated VGAM is inhibition of expression of VGAM1698 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1698 correlate with, and may be deduced from, the identity of the target genes which VGAM1698 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[57191] KIAA1126 (Accession XM\_050325) is a VGAM1698 host target gene. KIAA1126 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA

encoded by KIAA1126, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1126 BINDING SITE, designated SEQ ID:35605, to the nucleotide sequence of VGAM1698 RNA, herein designated VGAM RNA, also designated SEQ ID:4409.

[57192] A function of VGAM1698 is therefore inhibition of KIAA1126 (Accession XM\_050325). Accordingly, utilities of VGAM1698 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1126. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1699 (VGAM1699) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[57193] VGAM1699 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1699 was detected is described hereinabove with reference to Figs. 1-8.

[57194] VGAM1699 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Ectocarpus Siliculosus Virus. VGAM1699 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[57195] VGAM1699 gene encodes a VGAM1699 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1699 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1699 precursor RNA is designated SEQ ID:1685, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1685 is located at position 53142 relative to the genome of Ectocarpus Siliculosus Virus.

[57196] VGAM1699 precursor RNA folds onto itself, forming VGAM1699 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[57197] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1699 folded precursor RNA into VGAM1699 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1699 RNA is designated SEQ ID:4410, and is provided hereinbelow with reference to the sequence listing part.

[57198] VGAM1699 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1699 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1699 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[57199] VGAM1699 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1699 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1699 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1699 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1699 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[57200] The complementary binding of VGAM1699 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1699 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1699

host target RNA into VGAM1699 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[57201] It is appreciated that VGAM1699 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1699 host target genes. The mRNA of each one of this plurality of VGAM1699 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1699 RNA, herein designated VGAM RNA, and which when bound by VGAM1699 RNA causes inhibition of translation of respective one or more VGAM1699 host target proteins.

[57202] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1699 gene, herein designated VGAM GENE, on one or more VGAM1699 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[57203] It is yet further appreciated that a function of VGAM1699 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1699 include diagnosis, prevention and treatment of viral infection by Ectocarpus Siliculosus Virus. Specific functions, and accordingly utilities, of VGAM1699 correlate with, and may be deduced from, the identity of the host target genes which VGAM1699 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[57204] Nucleotide sequences of the VGAM1699 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1699 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1699 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1699 are further

described hereinbelow with reference to Table 1.

[57205] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1699 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1699 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[57206] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1699 gene, herein designated VGAM is inhibition of expression of VGAM1699 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1699 correlate with, and may be deduced from, the identity of the target genes which VGAM1699 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[57207] Hippocalcin-like 1 (HPCAL1, Accession NM\_002149) is a VGAM1699 host target gene. HPCAL1 BINDING SITE1 and HPCAL1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by HPCAL1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of HPCAL1 BINDING SITE1 and HPCAL1 BINDING SITE2, designated SEQ ID:7926 and SEQ ID:28633 respectively, to the nucleotide sequence of VGAM1699 RNA, herein designated VGAM RNA, also designated SEQ ID:4410.

[57208] A function of VGAM1699 is therefore inhibition of Hippocalcin-like 1 (HPCAL1, Accession NM\_002149). Accordingly, utilities of VGAM1699 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HPCAL1. FLJ11712 (Accession NM\_024570) is another VGAM1699 host target gene. FLJ11712 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ11712, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11712 BINDING SITE, designated SEQ ID:23795, to the nucleotide sequence of VGAM1699 RNA, herein designated VGAM RNA, also designated SEQ ID:4410.

[57209] Another function of VGAM1699 is therefore inhibition of FLJ11712 (Accession NM\_024570). Accordingly, utilities of VGAM1699 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ11712. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1700 (VGAM1700) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[57210] VGAM1700 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1700 was detected is described hereinabove with reference to Figs. 1–8.

[57211] VGAM1700 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectocarpus Siliculosus Virus. VGAM1700 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[57212] VGAM1700 gene encodes a VGAM1700 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1700 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1700 precursor RNA is designated SEQ ID:1686, and is provided hereinbelow with ref–

erence to the sequence listing part. Nucleotide sequence SEQ ID:1686 is located at position 54256 relative to the genome of Ectocarpus Siliculosus Virus.

- [57213] VGAM1700 precursor RNA folds onto itself, forming VGAM1700 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [57214] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1700 folded precursor RNA into VGAM1700 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of VGAM1700 RNA is designated SEQ ID:4411, and is provided hereinbelow with reference to the sequence listing part.

[57215] VGAM1700 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1700 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1700 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[57216] VGAM1700 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1700 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1700 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1700 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM1700 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[57217] The complementary binding of VGAM1700 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1700 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1700 host target RNA into VGAM1700 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[57218] It is appreciated that VGAM1700 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1700 host target genes. The mRNA of each one of this plurality of VGAM1700 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1700 RNA, herein designated VGAM RNA, and which when bound by VGAM1700 RNA causes

inhibition of translation of respective one or more VGAM1700 host target proteins.

[57219] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1700 gene, herein designated VGAM GENE, on one or more VGAM1700 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[57220] It is yet further appreciated that a function of VGAM1700 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1700 include diagnosis, prevention and

treatment of viral infection by Ectocarpus Siliculosus Virus. Specific functions, and accordingly utilities, of VGAM1700 correlate with, and may be deduced from, the identity of the host target genes which VGAM1700 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[57221] Nucleotide sequences of the VGAM1700 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1700 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1700 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1700 are further described hereinbelow with reference to Table 1.

[57222] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1700 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1700 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[57223] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1700 gene, herein designated VGAM is inhibition of expression of VGAM1700 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM1700 correlate with, and may be deduced from, the identity of the target genes which VGAM1700 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[57224] RAD52 Homolog (*S. cerevisiae*) (RAD52, Accession NM\_134422) is a VGAM1700 host target gene. RAD52 BINDING SITE1 through RAD52 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RAD52, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAD52 BINDING SITE1 through RAD52 BINDING SITE3, designated SEQ ID:28640, SEQ ID:28650 and SEQ ID:28659 respectively, to the nucleotide sequence of VGAM1700 RNA, herein designated VGAM RNA, also designated SEQ ID:4411.

[57225] A function of VGAM1700 is therefore inhibition of RAD52 Homolog (*S. cerevisiae*) (RAD52, Accession NM\_134422). Accordingly, utilities of VGAM1700 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAD52. FLJ21106 (Accession NM\_025097) is another VGAM1700 host target gene.

FLJ21106 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ21106, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21106 BINDING SITE, designated SEQ ID:24732, to the nucleotide sequence of VGAM1700 RNA, herein designated VGAM RNA, also designated SEQ ID:4411.

[57226] Another function of VGAM1700 is therefore inhibition of FLJ21106 (Accession NM\_025097). Accordingly, utilities of VGAM1700 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21106. KIAA0429 (Accession NM\_014751) is another VGAM1700 host target gene. KIAA0429 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0429, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0429 BINDING SITE, designated SEQ ID:16462, to the nucleotide sequence of VGAM1700 RNA, herein designated VGAM RNA, also designated SEQ ID:4411.

[57227] Another function of VGAM1700 is therefore inhibition of KIAA0429 (Accession NM\_014751). Accordingly, utilities of VGAM1700 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0429. PORIMIN (Accession NM\_052932) is another VGAM1700 host target gene. PORIMIN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PORIMIN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PORIMIN BINDING SITE, designated SEQ ID:27489, to the nucleotide sequence of VGAM1700 RNA, herein designated VGAM RNA, also designated SEQ ID:4411.

[57228] Another function of VGAM1700 is therefore inhibition of PORIMIN (Accession NM\_052932). Accordingly, utilities of VGAM1700 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PORIMIN. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1701 (VGAM1701) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[57229] VGAM1701 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1701 was detected is described hereinabove with reference to Figs. 1–8.

[57230] VGAM1701 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectocarpus Siliculosus Virus. VGAM1701 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[57231] VGAM1701 gene encodes a VGAM1701 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1701 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1701 precursor RNA is designated SEQ ID:1687, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1687 is located at position 53594 relative to the genome of Ectocarpus Siliculosus Virus.

[57232] VGAM1701 precursor RNA folds onto itself, forming VGAM1701 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[57233] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1701 folded precursor RNA into VGAM1701 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1701 RNA is designated SEQ ID:4412, and is provided hereinbelow with reference to the sequence listing part.

[57234] VGAM1701 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1701 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1701 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[57235] VGAM1701 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1701 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1701 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1701 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1701 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[57236] The complementary binding of VGAM1701 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1701 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1701 host target RNA into VGAM1701 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[57237] It is appreciated that VGAM1701 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1701 host target genes. The mRNA of each one of this plurality of VGAM1701 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1701 RNA, herein designated VGAM RNA, and which when bound by VGAM1701 RNA causes inhibition of translation of respective one or more VGAM1701 host target proteins.

[57238] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1701 gene, herein designated VGAM GENE, on one or more VGAM1701 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[57239] It is yet further appreciated that a function of VGAM1701 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1701 include diagnosis, prevention and treatment of viral infection by Ectocarpus Siliculosus Virus. Specific functions, and accordingly utilities, of VGAM1701 correlate with, and may be deduced from, the identity of the host target genes which VGAM1701 binds and inhibits, and the function of these host target genes,

as elaborated hereinbelow.

[57240] Nucleotide sequences of the VGAM1701 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1701 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1701 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1701 are further described hereinbelow with reference to Table 1.

[57241] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1701 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1701 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[57242] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1701 gene, herein designated VGAM is inhibition of expression of VGAM1701 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1701 correlate with, and may be deduced from, the identity of the target genes which VGAM1701 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[57243] ALEX2 (Accession NM\_014782) is a VGAM1701 host target gene. ALEX2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ALEX2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALEX2 BINDING SITE, designated SEQ ID:16635, to the nucleotide sequence of VGAM1701 RNA, herein designated VGAM RNA, also designated SEQ ID:4412.

[57244] A function of VGAM1701 is therefore inhibition of ALEX2 (Accession NM\_014782), a gene which play a role in tumor suppression, possibly by being involved in the regulation of normal cell growth. Accordingly, utilities of VGAM1701 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALEX2. The function of ALEX2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1449.DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide, Y Chromosome (DBY, Accession NM\_004660) is another VGAM1701 host target gene. DBY BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by DBY, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DBY BINDING SITE, designated SEQ ID:11027, to the nucleotide sequence of VGAM1701 RNA, herein designated VGAM RNA, also designated SEQ ID:4412.

[57245] Another function of VGAM1701 is therefore inhibition of DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide, Y Chromosome (DBY, Accession NM\_004660), a gene which plays a key role in the spermatogenic process. Accordingly, utilities of VGAM1701 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DBY. The function of DBY and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM374. Inositol 1,4,5-triphosphate Receptor, Type 3 (ITPR3, Accession NM\_002224) is another VGAM1701 host target gene. ITPR3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITPR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of ITPR3 BINDING SITE, designated SEQ ID:8000, to the nucleotide sequence of VGAM1701 RNA, herein designated VGAM RNA, also designated SEQ ID:4412.

[57246] Another function of VGAM1701 is therefore inhibition of Inositol 1,4,5-triphosphate Receptor, Type 3 (ITPR3, Accession NM\_002224), a gene which may be responsible for calcium release from intracellular stores. Accordingly, utilities of VGAM1701 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITPR3. The function of ITPR3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM310. Ubiquitination Factor E4A (UFD2 homolog, yeast) (UBE4A, Accession NM\_004788) is another VGAM1701 host target gene. UBE4A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UBE4A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBE4A BINDING SITE, designated SEQ ID:11198, to the nucleotide sequence of VGAM1701 RNA, herein designated VGAM RNA,

also designated SEQ ID:4412.

[57247] Another function of VGAM1701 is therefore inhibition of Ubiquitination Factor E4A (UFD2 homolog, yeast) (UBE4A, Accession NM\_004788), a gene which binds to the ubiquitin moieties of preformed conjugates and catalyzes ubiquitin chain assembly in conjunction with E1, E2, and E3. Accordingly, utilities of VGAM1701 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE4A. The function of UBE4A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM60.BTB (POZ) Domain Containing 3 (BTBD3, Accession NM\_014962) is another VGAM1701 host target gene. BTBD3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by BTBD3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BTBD3 BINDING SITE, designated SEQ ID:17339, to the nucleotide sequence of VGAM1701 RNA, herein designated VGAM RNA, also designated SEQ ID:4412.

[57248] Another function of VGAM1701 is therefore inhibition of

BTB (POZ) Domain Containing 3 (BTBD3, Accession NM\_014962). Accordingly, utilities of VGAM1701 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BTBD3. Calcium/calmodulin-dependent Protein Kinase Kinase 1, Alpha (CAMKK1, Accession NM\_032294) is another VGAM1701 host target gene. CAMKK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAMKK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAMKK1 BINDING SITE, designated SEQ ID:26066, to the nucleotide sequence of VGAM1701 RNA, herein designated VGAM RNA, also designated SEQ ID:4412.

[57249] Another function of VGAM1701 is therefore inhibition of Calcium/calmodulin-dependent Protein Kinase Kinase 1, Alpha (CAMKK1, Accession NM\_032294). Accordingly, utilities of VGAM1701 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAMKK1. DKFZp434C0923 (Accession NM\_017598) is another VGAM1701 host target gene. DKFZp434C0923 BINDING SITE is HOST TARGET binding site found in the

3` untranslated region of mRNA encoded by DKFZp434C0923, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434C0923 BINDING SITE, designated SEQ ID:19065, to the nucleotide sequence of VGAM1701 RNA, herein designated VGAM RNA, also designated SEQ ID:4412.

[57250] Another function of VGAM1701 is therefore inhibition of DKFZp434C0923 (Accession NM\_017598). Accordingly, utilities of VGAM1701 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434C0923. FLJ10292 (Accession NM\_018048) is another VGAM1701 host target gene. FLJ10292 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10292, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10292 BINDING SITE, designated SEQ ID:19802, to the nucleotide sequence of VGAM1701 RNA, herein designated VGAM RNA, also designated SEQ ID:4412.

[57251] Another function of VGAM1701 is therefore inhibition of

FLJ10292 (Accession NM\_018048). Accordingly, utilities of VGAM1701 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10292. FLJ11730 (Accession NM\_022756) is another VGAM1701 host target gene. FLJ11730 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11730, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11730 BINDING SITE, designated SEQ ID:22995, to the nucleotide sequence of VGAM1701 RNA, herein designated VGAM RNA, also designated SEQ ID:4412.

[57252] Another function of VGAM1701 is therefore inhibition of FLJ11730 (Accession NM\_022756). Accordingly, utilities of VGAM1701 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11730. FLJ21432 (Accession NM\_024551) is another VGAM1701 host target gene. FLJ21432 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21432, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of FLJ21432 BINDING SITE, designated SEQ ID:23768, to the nucleotide sequence of VGAM1701 RNA, herein designated VGAM RNA, also designated SEQ ID:4412.

[57253] Another function of VGAM1701 is therefore inhibition of FLJ21432 (Accession NM\_024551). Accordingly, utilities of VGAM1701 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21432. KIAA0450 (Accession NM\_014638) is another VGAM1701 host target gene. KIAA0450 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0450, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0450 BINDING SITE, designated SEQ ID:16036, to the nucleotide sequence of VGAM1701 RNA, herein designated VGAM RNA, also designated SEQ ID:4412.

[57254] Another function of VGAM1701 is therefore inhibition of KIAA0450 (Accession NM\_014638). Accordingly, utilities of VGAM1701 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0450. KIAA0544 (Accession XM\_048119) is another

VGAM1701 host target gene. KIAA0544 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0544, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0544 BINDING SITE, designated SEQ ID:35116, to the nucleotide sequence of VGAM1701 RNA, herein designated VGAM RNA, also designated SEQ ID:4412.

[57255] Another function of VGAM1701 is therefore inhibition of KIAA0544 (Accession XM\_048119). Accordingly, utilities of VGAM1701 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0544. MGC12966 (Accession NM\_032706) is another VGAM1701 host target gene. MGC12966 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC12966, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC12966 BINDING SITE, designated SEQ ID:26420, to the nucleotide sequence of VGAM1701 RNA, herein designated VGAM RNA, also designated SEQ ID:4412.

[57256] Another function of VGAM1701 is therefore inhibition of MGC12966 (Accession NM\_032706). Accordingly, utilities of VGAM1701 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC12966. Phosphodiesterase 4D Interacting Protein (myomegalin) (PDE4DIP, Accession XM\_170929) is another VGAM1701 host target gene. PDE4DIP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDE4DIP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE4DIP BINDING SITE, designated SEQ ID:45710, to the nucleotide sequence of VGAM1701 RNA, herein designated VGAM RNA, also designated SEQ ID:4412.

[57257] Another function of VGAM1701 is therefore inhibition of Phosphodiesterase 4D Interacting Protein (myomegalin) (PDE4DIP, Accession XM\_170929). Accordingly, utilities of VGAM1701 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE4DIP. LOC139221 (Accession XM\_066558) is another VGAM1701 host target gene. LOC139221 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by LOC139221, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC139221 BINDING SITE, designated SEQ ID:37332, to the nucleotide sequence of VGAM1701 RNA, herein designated VGAM RNA, also designated SEQ ID:4412.

[57258] Another function of VGAM1701 is therefore inhibition of LOC139221 (Accession XM\_066558). Accordingly, utilities of VGAM1701 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC139221. LOC146287 (Accession XM\_096967) is another VGAM1701 host target gene. LOC146287 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146287, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146287 BINDING SITE, designated SEQ ID:40690, to the nucleotide sequence of VGAM1701 RNA, herein designated VGAM RNA, also designated SEQ ID:4412.

[57259] Another function of VGAM1701 is therefore inhibition of LOC146287 (Accession XM\_096967). Accordingly, utilities

of VGAM1701 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146287. LOC149296 (Accession XM\_086481) is another VGAM1701 host target gene. LOC149296 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC149296, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149296 BINDING SITE, designated SEQ ID:38696, to the nucleotide sequence of VGAM1701 RNA, herein designated VGAM RNA, also designated SEQ ID:4412.

[57260] Another function of VGAM1701 is therefore inhibition of LOC149296 (Accession XM\_086481). Accordingly, utilities of VGAM1701 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149296. LOC253461 (Accession XM\_172341) is another VGAM1701 host target gene. LOC253461 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC253461, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC253461 BINDING SITE, designated SEQ ID:46072, to the nucleotide sequence of VGAM1701 RNA, herein designated VGAM RNA, also designated SEQ ID:4412.

[57261] Another function of VGAM1701 is therefore inhibition of LOC253461 (Accession XM\_172341). Accordingly, utilities of VGAM1701 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253461. LOC58489 (Accession XM\_051862) is another VGAM1701 host target gene. LOC58489 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC58489, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC58489 BINDING SITE, designated SEQ ID:35906, to the nucleotide sequence of VGAM1701 RNA, herein designated VGAM RNA, also designated SEQ ID:4412.

[57262] Another function of VGAM1701 is therefore inhibition of LOC58489 (Accession XM\_051862). Accordingly, utilities of VGAM1701 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC58489. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 1702 (VGAM1702) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[57263] VGAM1702 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1702 was detected is described hereinabove with reference to Figs. 1–8.

[57264] VGAM1702 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectocarpus Siliculosus Virus. VGAM1702 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[57265] VGAM1702 gene encodes a VGAM1702 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1702 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1702 precursor RNA is designated SEQ ID:1688, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1688 is located at position 51117 relative to the

genome of Ectocarpus Siliculosus Virus.

[57266] VGAM1702 precursor RNA folds onto itself, forming VGAM1702 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[57267] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1702 folded precursor RNA into VGAM1702 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1702 RNA is designated SEQ ID:4413, and is provided hereinbelow with reference to the sequence listing part.

[57268] VGAM1702 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1702 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1702 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[57269] VGAM1702 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1702 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1702 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1702 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1702 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[57270] The complementary binding of VGAM1702 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1702 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1702 host target RNA into VGAM1702 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[57271] It is appreciated that VGAM1702 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1702 host target genes. The mRNA of each one of this plurality of VGAM1702 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1702 RNA, herein designated VGAM RNA, and which when bound by VGAM1702 RNA causes inhibition of translation of respective one or more VGAM1702 host target proteins.

[57272] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1702 gene, herein designated VGAM GENE, on one or more VGAM1702 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[57273] It is yet further appreciated that a function of VGAM1702 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1702 include diagnosis, prevention and treatment of viral infection by Ectocarpus Siliculosus Virus. Specific functions, and accordingly utilities, of

VGAM1702 correlate with, and may be deduced from, the identity of the host target genes which VGAM1702 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[57274] Nucleotide sequences of the VGAM1702 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1702 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1702 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1702 are further described hereinbelow with reference to Table 1.

[57275] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1702 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1702 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[57276] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1702 gene, herein designated VGAM is inhibition of expression of VGAM1702 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1702 correlate with, and may be deduced

from, the identity of the target genes which VGAM1702 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[57277] ATPase, H<sup>+</sup> Transporting, Lysosomal 42kDa, V1 Subunit C, Isoform 1 (ATP6V1C1, Accession NM\_001695) is a VGAM1702 host target gene. ATP6V1C1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP6V1C1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP6V1C1 BINDING SITE, designated SEQ ID:7416, to the nucleotide sequence of VGAM1702 RNA, herein designated VGAM RNA, also designated SEQ ID:4413.

[57278] A function of VGAM1702 is therefore inhibition of ATPase, H<sup>+</sup> Transporting, Lysosomal 42kDa, V1 Subunit C, Isoform 1 (ATP6V1C1, Accession NM\_001695), a gene which is necessary for the assembly of the catalytic sector of the enzyme. Accordingly, utilities of VGAM1702 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP6V1C1. The function of ATP6V1C1 has been established by previous studies. Van Hille et al. (1993) cloned subunit C from a human osteo-

clastoma cDNA library with probes developed by PCR from the bovine cDNA sequence (Nelson et al., 1990). The deduced 382-amino acid human ATP6C protein has a calculated molecular mass of 41,941 Da and shows 99% sequence identity with bovine ATP6C. Northern blot analysis detected ubiquitous and comparable expression of a 1.9-kb transcript and a fainter doublet of 6.0–7.0 kb.

[57279] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[57280] Nelson, H.; Mandiyan, S.; Noumi, T.; Moriyama, Y.; Miedel, M. C.; Nelson, N. : Molecular cloning of cDNA encoding the C subunit of H(+)-ATPase from bovine chromaffin granules. J. Biol. Chem. 265: 20390–20393, 1990. ; and

[57281] van Hille, B.; Vanek, M.; Richener, H.; Green, J. R.; Bilbe, G. : Cloning and tissue distribution of subunits C, D, and E of the human vacuolar H(+)-ATPase. Biochem. Biophys. Res. Commu.

[57282] Further studies establishing the function and utilities of ATP6V1C1 are found in John Hopkins OMIM database record ID 603097, and in cited publications numbered 8661–8662 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Protein

Kinase C, Nu (PRKCN, Accession NM\_005813) is another VGAM1702 host target gene. PRKCN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRKCN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRKCN BINDING SITE, designated SEQ ID:12401, to the nucleotide sequence of VGAM1702 RNA, herein designated VGAM RNA, also designated SEQ ID:4413.

[57283] Another function of VGAM1702 is therefore inhibition of Protein Kinase C, Nu (PRKCN, Accession NM\_005813). Accordingly, utilities of VGAM1702 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKCN. WAS Protein Family, Member 3 (WASF3, Accession NM\_006646) is another VGAM1702 host target gene. WASF3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by WASF3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WASF3 BINDING SITE, designated SEQ ID:13444, to the nucleotide sequence of

VGAM1702 RNA, herein designated VGAM RNA, also designated SEQ ID:4413.

[57284] Another function of VGAM1702 is therefore inhibition of WAS Protein Family, Member 3 (WASF3, Accession NM\_006646), a gene which stimulates actin polymerization. Accordingly, utilities of VGAM1702 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WASF3. The function of WASF3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1692. Calcium/calmodulin-dependent Protein Kinase Kinase 1, Alpha (CAMKK1, Accession NM\_032294) is another VGAM1702 host target gene. CAMKK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAMKK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAMKK1 BINDING SITE, designated SEQ ID:26064, to the nucleotide sequence of VGAM1702 RNA, herein designated VGAM RNA, also designated SEQ ID:4413.

[57285] Another function of VGAM1702 is therefore inhibition of

Calcium/calmodulin-dependent Protein Kinase Kinase 1, Alpha (CAMKK1, Accession NM\_032294). Accordingly, utilities of VGAM1702 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAMKK1. FLJ12294 (Accession NM\_025100) is another VGAM1702 host target gene. FLJ12294 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12294, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12294 BINDING SITE, designated SEQ ID:24747, to the nucleotide sequence of VGAM1702 RNA, herein designated VGAM RNA, also designated SEQ ID:4413.

[57286] Another function of VGAM1702 is therefore inhibition of FLJ12294 (Accession NM\_025100). Accordingly, utilities of VGAM1702 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12294. FLJ23598 (Accession XM\_170689) is another VGAM1702 host target gene. FLJ23598 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ23598, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23598 BINDING SITE, designated SEQ ID:45467, to the nucleotide sequence of VGAM1702 RNA, herein designated VGAM RNA, also designated SEQ ID:4413.

[57287] Another function of VGAM1702 is therefore inhibition of FLJ23598 (Accession XM\_170689). Accordingly, utilities of VGAM1702 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23598. T-box 4 (TBX4, Accession NM\_018488) is another VGAM1702 host target gene. TBX4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TBX4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TBX4 BINDING SITE, designated SEQ ID:20547, to the nucleotide sequence of VGAM1702 RNA, herein designated VGAM RNA, also designated SEQ ID:4413.

[57288] Another function of VGAM1702 is therefore inhibition of T-box 4 (TBX4, Accession NM\_018488). Accordingly, utilities of VGAM1702 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with TBX4. LOC148147 (Accession XM\_086071) is another VGAM1702 host target gene. LOC148147 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148147, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148147 BINDING SITE, designated SEQ ID:38475, to the nucleotide sequence of VGAM1702 RNA, herein designated VGAM RNA, also designated SEQ ID:4413.

[57289] Another function of VGAM1702 is therefore inhibition of LOC148147 (Accession XM\_086071). Accordingly, utilities of VGAM1702 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148147. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1703 (VGAM1703) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[57290] VGAM1703 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1703 was detected is described hereinabove with reference to Figs. 1–8.

[57291] VGAM1703 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectocarpus Siliculosus Virus. VGAM1703 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[57292] VGAM1703 gene encodes a VGAM1703 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1703 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1703 precursor RNA is designated SEQ ID:1689, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1689 is located at position 53714 relative to the genome of Ectocarpus Siliculosus Virus.

[57293] VGAM1703 precursor RNA folds onto itself, forming VGAM1703 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[57294] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1703 folded precursor RNA into VGAM1703 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM1703 RNA is designated SEQ ID:4414, and is provided hereinbelow with reference to the sequence listing part.

[57295] VGAM1703 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1703 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1703 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[57296] VGAM1703 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1703 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1703 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1703 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1703 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[57297] The complementary binding of VGAM1703 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1703 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1703 host target RNA into VGAM1703 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[57298] It is appreciated that VGAM1703 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1703 host target genes. The mRNA of each one of this plurality of VGAM1703 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1703 RNA, herein designated VGAM RNA, and which when bound by VGAM1703 RNA causes inhibition of translation of respective one or more VGAM1703 host target proteins.

[57299] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1703 gene, herein designated VGAM GENE, on one or more VGAM1703 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[57300] It is yet further appreciated that a function of VGAM1703 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1703 include diagnosis, prevention and treatment of viral infection by Ectocarpus Siliculosus Virus. Specific functions, and accordingly utilities, of VGAM1703 correlate with, and may be deduced from, the identity of the host target genes which VGAM1703 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[57301] Nucleotide sequences of the VGAM1703 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1703 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM1703 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1703 are further described hereinbelow with reference to Table 1.

[57302] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1703 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1703 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[57303] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1703 gene, herein designated VGAM is inhibition of expression of VGAM1703 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1703 correlate with, and may be deduced from, the identity of the target genes which VGAM1703 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[57304] RAD52 Homolog (*S. cerevisiae*) (RAD52, Accession NM\_134422) is a VGAM1703 host target gene. RAD52 BINDING SITE1 through RAD52 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of

mRNA encoded by RAD52, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAD52 BINDING SITE1 through RAD52 BINDING SITE3, designated SEQ ID:28640, SEQ ID:28650 and SEQ ID:28659 respectively, to the nucleotide sequence of VGAM1703 RNA, herein designated VGAM RNA, also designated SEQ ID:4414.

[57305] A function of VGAM1703 is therefore inhibition of RAD52 Homolog (*S. cerevisiae*) (RAD52, Accession NM\_134422). Accordingly, utilities of VGAM1703 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAD52. ChGn (Accession NM\_018371) is another VGAM1703 host target gene. ChGn BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ChGn, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ChGn BINDING SITE, designated SEQ ID:20390, to the nucleotide sequence of VGAM1703 RNA, herein designated VGAM RNA, also designated SEQ ID:4414.

[57306] Another function of VGAM1703 is therefore inhibition of

ChGn (Accession NM\_018371). Accordingly, utilities of VGAM1703 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ChGn. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1704 (VGAM1704) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[57307] VGAM1704 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1704 was detected is described hereinabove with reference to Figs. 1-8.

[57308] VGAM1704 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectocarpus Siliculosus Virus. VGAM1704 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[57309] VGAM1704 gene encodes a VGAM1704 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1704 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM1704 precursor RNA is designated SEQ ID:1690, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1690 is located at position 52170 relative to the genome of Ectocarpus Siliculosus Virus.

- [57310] VGAM1704 precursor RNA folds onto itself, forming VGAM1704 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [57311] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1704 folded precursor RNA into VGAM1704 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1704 RNA is designated SEQ ID:4415, and

is provided hereinbelow with reference to the sequence listing part.

[57312] VGAM1704 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1704 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1704 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[57313] VGAM1704 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1704 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1704 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM1704 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1704 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[57314] The complementary binding of VGAM1704 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1704 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1704 host target RNA into VGAM1704 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[57315] It is appreciated that VGAM1704 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1704 host target genes. The mRNA of each one of this plurality of VGAM1704 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com–

plementary to VGAM1704 RNA, herein designated VGAM RNA, and which when bound by VGAM1704 RNA causes inhibition of translation of respective one or more VGAM1704 host target proteins.

[57316] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1704 gene, herein designated VGAM GENE, on one or more VGAM1704 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[57317] It is yet further appreciated that a function of VGAM1704 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1704 include diagnosis, prevention and treatment of viral infection by Ectocarpus Siliculosus Virus. Specific functions, and accordingly utilities, of VGAM1704 correlate with, and may be deduced from, the identity of the host target genes which VGAM1704 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[57318] Nucleotide sequences of the VGAM1704 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1704 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1704 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1704 are further described hereinbelow with reference to Table 1.

[57319] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1704 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1704 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[57320] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM1704 gene, herein designated VGAM is inhibition of expression of VGAM1704 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1704 correlate with, and may be deduced from, the identity of the target genes which VGAM1704 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[57321] Ephrin-B2 (EFNB2, Accession NM\_004093) is a VGAM1704 host target gene. EFNB2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EFNB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EFNB2 BINDING SITE, designated SEQ ID:10297, to the nucleotide sequence of VGAM1704 RNA, herein designated VGAM RNA, also designated SEQ ID:4415.

[57322] A function of VGAM1704 is therefore inhibition of Ephrin-B2 (EFNB2, Accession NM\_004093). Accordingly, utilities of VGAM1704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EFNB2. Early Growth Response 1 (EGR1, Accession NM\_001964) is another VGAM1704 host target gene.

EGR1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EGR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGR1 BINDING SITE, designated SEQ ID:7692, to the nucleotide sequence of VGAM1704 RNA, herein designated VGAM RNA, also designated SEQ ID:4415.

[57323] Another function of VGAM1704 is therefore inhibition of Early Growth Response 1 (EGR1, Accession NM\_001964). Accordingly, utilities of VGAM1704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGR1. Fibroblast Growth Factor 2 (basic) (FGF2, Accession NM\_002006) is another VGAM1704 host target gene. FGF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FGF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGF2 BINDING SITE, designated SEQ ID:7744, to the nucleotide sequence of VGAM1704 RNA, herein designated VGAM RNA, also designated SEQ ID:4415.

[57324] Another function of VGAM1704 is therefore inhibition of Fibroblast Growth Factor 2 (basic) (FGF2, Accession NM\_002006), a gene which probably involved in nervous system development and function. Accordingly, utilities of VGAM1704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGF2. The function of FGF2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM51.5–hydroxytryptamine (serotonin) Receptor 2C (HTR2C, Accession NM\_000868) is another VGAM1704 host target gene. HTR2C BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HTR2C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HTR2C BINDING SITE, designated SEQ ID:6535, to the nucleotide sequence of VGAM1704 RNA, herein designated VGAM RNA, also designated SEQ ID:4415.

[57325] Another function of VGAM1704 is therefore inhibition of 5–hydroxytryptamine (serotonin) Receptor 2C (HTR2C, Accession NM\_000868), a gene which activates phospho–

lipase C and regulates intracellular calcium flux. Accordingly, utilities of VGAM1704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTR2C. The function of HTR2C and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1052.

Inositol 1,4,5-triphosphate Receptor, Type 3 (ITPR3, Accession NM\_002224) is another VGAM1704 host target gene.

ITPR3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITPR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITPR3 BINDING SITE, designated SEQ ID:7999, to the nucleotide sequence of VGAM1704 RNA, herein designated VGAM RNA, also designated SEQ ID:4415.

[57326] Another function of VGAM1704 is therefore inhibition of Inositol 1,4,5-triphosphate Receptor, Type 3 (ITPR3, Accession NM\_002224), a gene which may be responsible for calcium release from intracellular stores. Accordingly, utilities of VGAM1704 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with ITPR3. The function of ITPR3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM310. Proteasome (prosome, macropain) Subunit, Beta Type, 2 (PSMB2, Accession NM\_002794) is another VGAM1704 host target gene. PSMB2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PSMB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSMB2 BINDING SITE, designated SEQ ID:8673, to the nucleotide sequence of VGAM1704 RNA, herein designated VGAM RNA, also designated SEQ ID:4415.

[57327] Another function of VGAM1704 is therefore inhibition of Proteasome (prosome, macropain) Subunit, Beta Type, 2 (PSMB2, Accession NM\_002794). Accordingly, utilities of VGAM1704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSMB2. Calneuron 1 (CALN1, Accession NM\_031468) is another VGAM1704 host target gene. CALN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CALN1, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CALN1 BINDING SITE, designated SEQ ID:25519, to the nucleotide sequence of VGAM1704 RNA, herein designated VGAM RNA, also designated SEQ ID:4415.

[57328] Another function of VGAM1704 is therefore inhibition of Calneuron 1 (CALN1, Accession NM\_031468). Accordingly, utilities of VGAM1704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CALN1. Calcium/calmodulin-dependent Protein Kinase Kinase 1, Alpha (CAMKK1, Accession NM\_032294) is another VGAM1704 host target gene. CAMKK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAMKK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAMKK1 BINDING SITE, designated SEQ ID:26068, to the nucleotide sequence of VGAM1704 RNA, herein designated VGAM RNA, also designated SEQ ID:4415.

[57329] Another function of VGAM1704 is therefore inhibition of Calcium/calmodulin-dependent Protein Kinase Kinase 1,

Alpha (CAMKK1, Accession NM\_032294). Accordingly, utilities of VGAM1704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAMKK1. DC-TM4F2 (Accession NM\_030927) is another VGAM1704 host target gene. DC-TM4F2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DC-TM4F2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DC-TM4F2 BINDING SITE, designated SEQ ID:25199, to the nucleotide sequence of VGAM1704 RNA, herein designated VGAM RNA, also designated SEQ ID:4415.

[57330] Another function of VGAM1704 is therefore inhibition of DC-TM4F2 (Accession NM\_030927). Accordingly, utilities of VGAM1704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DC-TM4F2. DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 34 (DDX34, Accession NM\_014681) is another VGAM1704 host target gene. DDX34 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DDX34, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDX34 BINDING SITE, designated SEQ ID:16169, to the nucleotide sequence of VGAM1704 RNA, herein designated VGAM RNA, also designated SEQ ID:4415.

[57331] Another function of VGAM1704 is therefore inhibition of DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 34 (DDX34, Accession NM\_014681). Accordingly, utilities of VGAM1704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX34. DRIL2 (Accession NM\_006465) is another VGAM1704 host target gene. DRIL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DRIL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DRIL2 BINDING SITE, designated SEQ ID:13188, to the nucleotide sequence of VGAM1704 RNA, herein designated VGAM RNA, also designated SEQ ID:4415.

[57332] Another function of VGAM1704 is therefore inhibition of DRIL2 (Accession NM\_006465). Accordingly, utilities of VGAM1704 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with DRIL2. FLJ12294 (Accession NM\_025100) is another VGAM1704 host target gene. FLJ12294 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12294, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12294 BINDING SITE, designated SEQ ID:24743, to the nucleotide sequence of VGAM1704 RNA, herein designated VGAM RNA, also designated SEQ ID:4415.

[57333] Another function of VGAM1704 is therefore inhibition of FLJ12294 (Accession NM\_025100). Accordingly, utilities of VGAM1704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12294. FLJ13456 (Accession XM\_038291) is another VGAM1704 host target gene. FLJ13456 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13456, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13456 BINDING SITE, designated SEQ ID:32800, to the nucleotide

sequence of VGAM1704 RNA, herein designated VGAM RNA, also designated SEQ ID:4415.

[57334] Another function of VGAM1704 is therefore inhibition of FLJ13456 (Accession XM\_038291). Accordingly, utilities of VGAM1704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13456. FLJ20489 (Accession NM\_017842) is another VGAM1704 host target gene. FLJ20489 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ20489, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20489 BINDING SITE, designated SEQ ID:19507, to the nucleotide sequence of VGAM1704 RNA, herein designated VGAM RNA, also designated SEQ ID:4415.

[57335] Another function of VGAM1704 is therefore inhibition of FLJ20489 (Accession NM\_017842). Accordingly, utilities of VGAM1704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20489. FLJ21551 (Accession NM\_024801) is another VGAM1704 host target gene. FLJ21551 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by FLJ21551, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21551 BINDING SITE, designated SEQ ID:24181, to the nucleotide sequence of VGAM1704 RNA, herein designated VGAM RNA, also designated SEQ ID:4415.

[57336] Another function of VGAM1704 is therefore inhibition of FLJ21551 (Accession NM\_024801). Accordingly, utilities of VGAM1704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21551. FLJ22362 (Accession NM\_022823) is another VGAM1704 host target gene. FLJ22362 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ22362, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22362 BINDING SITE, designated SEQ ID:23105, to the nucleotide sequence of VGAM1704 RNA, herein designated VGAM RNA, also designated SEQ ID:4415.

[57337] Another function of VGAM1704 is therefore inhibition of FLJ22362 (Accession NM\_022823). Accordingly, utilities of

VGAM1704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22362. FLJ22692 (Accession NM\_025049) is another VGAM1704 host target gene. FLJ22692 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22692, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22692 BINDING SITE, designated SEQ ID:24644, to the nucleotide sequence of VGAM1704 RNA, herein designated VGAM RNA, also designated SEQ ID:4415.

[57338] Another function of VGAM1704 is therefore inhibition of FLJ22692 (Accession NM\_025049). Accordingly, utilities of VGAM1704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22692. FLJ23598 (Accession XM\_170689) is another VGAM1704 host target gene. FLJ23598 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ23598, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23598

BINDING SITE, designated SEQ ID:45468, to the nucleotide sequence of VGAM1704 RNA, herein designated VGAM RNA, also designated SEQ ID:4415.

[57339] Another function of VGAM1704 is therefore inhibition of FLJ23598 (Accession XM\_170689). Accordingly, utilities of VGAM1704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23598. KIAA0795 (Accession NM\_025010) is another VGAM1704 host target gene. KIAA0795 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0795, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0795 BINDING SITE, designated SEQ ID:24588, to the nucleotide sequence of VGAM1704 RNA, herein designated VGAM RNA, also designated SEQ ID:4415.

[57340] Another function of VGAM1704 is therefore inhibition of KIAA0795 (Accession NM\_025010). Accordingly, utilities of VGAM1704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0795. KIAA1872 (Accession XM\_031917) is another VGAM1704 host target gene. KIAA1872 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1872, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1872 BINDING SITE, designated SEQ ID:31518, to the nucleotide sequence of VGAM1704 RNA, herein designated VGAM RNA, also designated SEQ ID:4415.

[57341] Another function of VGAM1704 is therefore inhibition of KIAA1872 (Accession XM\_031917). Accordingly, utilities of VGAM1704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1872. LGP1 (Accession NM\_032484) is another VGAM1704 host target gene. LGP1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LGP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LGP1 BINDING SITE, designated SEQ ID:26232, to the nucleotide sequence of VGAM1704 RNA, herein designated VGAM RNA, also designated SEQ ID:4415.

[57342] Another function of VGAM1704 is therefore inhibition of

LGP1 (Accession NM\_032484). Accordingly, utilities of VGAM1704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LGP1. Mitogen-activated Protein Kinase Kinase 4 (MAP2K4, Accession NM\_003010) is another VGAM1704 host target gene. MAP2K4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAP2K4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP2K4 BINDING SITE, designated SEQ ID:8917, to the nucleotide sequence of VGAM1704 RNA, herein designated VGAM RNA, also designated SEQ ID:4415.

[57343] Another function of VGAM1704 is therefore inhibition of Mitogen-activated Protein Kinase Kinase 4 (MAP2K4, Accession NM\_003010). Accordingly, utilities of VGAM1704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP2K4. MGC29891 (Accession NM\_144618) is another VGAM1704 host target gene. MGC29891 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC29891, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC29891 BINDING SITE, designated SEQ ID:29438, to the nucleotide sequence of VGAM1704 RNA, herein designated VGAM RNA, also designated SEQ ID:4415.

[57344] Another function of VGAM1704 is therefore inhibition of MGC29891 (Accession NM\_144618). Accordingly, utilities of VGAM1704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC29891. Nup43 (Accession NM\_024647) is another VGAM1704 host target gene. Nup43 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by Nup43, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Nup43 BINDING SITE, designated SEQ ID:23937, to the nucleotide sequence of VGAM1704 RNA, herein designated VGAM RNA, also designated SEQ ID:4415.

[57345] Another function of VGAM1704 is therefore inhibition of Nup43 (Accession NM\_024647). Accordingly, utilities of VGAM1704 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with Nup43. Neurexophilin 3 (NXPH3, Accession XM\_037847) is another VGAM1704 host target gene. NXPH3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NXPH3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NXPH3 BINDING SITE, designated SEQ ID:32715, to the nucleotide sequence of VGAM1704 RNA, herein designated VGAM RNA, also designated SEQ ID:4415.

[57346] Another function of VGAM1704 is therefore inhibition of Neurexophilin 3 (NXPH3, Accession XM\_037847). Accordingly, utilities of VGAM1704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NXPH3. Regulator of G-protein Signalling 11 (RGS11, Accession NM\_003834) is another VGAM1704 host target gene. RGS11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RGS11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RGS11 BINDING SITE, des-

ignated SEQ ID:9925, to the nucleotide sequence of VGAM1704 RNA, herein designated VGAM RNA, also designated SEQ ID:4415.

[57347] Another function of VGAM1704 is therefore inhibition of Regulator of G-protein Signalling 11 (RGS11, Accession NM\_003834). Accordingly, utilities of VGAM1704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RGS11. ZAK (Accession NM\_133646) is another VGAM1704 host target gene. ZAK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZAK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZAK BINDING SITE, designated SEQ ID:28606, to the nucleotide sequence of VGAM1704 RNA, herein designated VGAM RNA, also designated SEQ ID:4415.

[57348] Another function of VGAM1704 is therefore inhibition of ZAK (Accession NM\_133646). Accordingly, utilities of VGAM1704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZAK. LOC115129 (Accession XM\_055292) is another VGAM1704 host target gene. LOC115129 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC115129, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115129 BINDING SITE, designated SEQ ID:36255, to the nucleotide sequence of VGAM1704 RNA, herein designated VGAM RNA, also designated SEQ ID:4415.

[57349] Another function of VGAM1704 is therefore inhibition of LOC115129 (Accession XM\_055292). Accordingly, utilities of VGAM1704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115129. LOC115330 (Accession NM\_138445) is another VGAM1704 host target gene. LOC115330 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC115330, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115330 BINDING SITE, designated SEQ ID:28811, to the nucleotide sequence of VGAM1704 RNA, herein designated VGAM RNA, also designated SEQ ID:4415.

[57350] Another function of VGAM1704 is therefore inhibition of

LOC115330 (Accession NM\_138445). Accordingly, utilities of VGAM1704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115330. LOC116437 (Accession XM\_058185) is another VGAM1704 host target gene. LOC116437 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC116437, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC116437 BINDING SITE, designated SEQ ID:36582, to the nucleotide sequence of VGAM1704 RNA, herein designated VGAM RNA, also designated SEQ ID:4415.

[57351] Another function of VGAM1704 is therefore inhibition of LOC116437 (Accession XM\_058185). Accordingly, utilities of VGAM1704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116437. LOC145955 (Accession XM\_096912) is another VGAM1704 host target gene. LOC145955 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145955, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC145955 BINDING SITE, designated SEQ ID:40644, to the nucleotide sequence of VGAM1704 RNA, herein designated VGAM RNA, also designated SEQ ID:4415.

[57352] Another function of VGAM1704 is therefore inhibition of LOC145955 (Accession XM\_096912). Accordingly, utilities of VGAM1704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145955. LOC148147 (Accession XM\_086071) is another VGAM1704 host target gene. LOC148147 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148147, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148147 BINDING SITE, designated SEQ ID:38477, to the nucleotide sequence of VGAM1704 RNA, herein designated VGAM RNA, also designated SEQ ID:4415.

[57353] Another function of VGAM1704 is therefore inhibition of LOC148147 (Accession XM\_086071). Accordingly, utilities of VGAM1704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148147. LOC149460 (Accession XM\_097652) is an-

other VGAM1704 host target gene. LOC149460 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149460, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149460 BINDING SITE, designated SEQ ID:40998, to the nucleotide sequence of VGAM1704 RNA, herein designated VGAM RNA, also designated SEQ ID:4415.

[57354] Another function of VGAM1704 is therefore inhibition of LOC149460 (Accession XM\_097652). Accordingly, utilities of VGAM1704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149460. LOC158819 (Accession XM\_098995) is another VGAM1704 host target gene. LOC158819 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158819, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158819 BINDING SITE, designated SEQ ID:42029, to the nucleotide sequence of VGAM1704 RNA, herein designated VGAM RNA, also designated SEQ ID:4415.

[57355] Another function of VGAM1704 is therefore inhibition of LOC158819 (Accession XM\_098995). Accordingly, utilities of VGAM1704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158819. LOC169026 (Accession XM\_095471) is another VGAM1704 host target gene. LOC169026 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC169026, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC169026 BINDING SITE, designated SEQ ID:40269, to the nucleotide sequence of VGAM1704 RNA, herein designated VGAM RNA, also designated SEQ ID:4415.

[57356] Another function of VGAM1704 is therefore inhibition of LOC169026 (Accession XM\_095471). Accordingly, utilities of VGAM1704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC169026. LOC196955 (Accession XM\_085210) is another VGAM1704 host target gene. LOC196955 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196955, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196955 BINDING SITE, designated SEQ ID:37931, to the nucleotide sequence of VGAM1704 RNA, herein designated VGAM RNA, also designated SEQ ID:4415.

[57357] Another function of VGAM1704 is therefore inhibition of LOC196955 (Accession XM\_085210). Accordingly, utilities of VGAM1704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196955. LOC199678 (Accession XM\_117111) is another VGAM1704 host target gene. LOC199678 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199678, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199678 BINDING SITE, designated SEQ ID:43227, to the nucleotide sequence of VGAM1704 RNA, herein designated VGAM RNA, also designated SEQ ID:4415.

[57358] Another function of VGAM1704 is therefore inhibition of LOC199678 (Accession XM\_117111). Accordingly, utilities of VGAM1704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC199678. LOC58489 (Accession XM\_051862) is another VGAM1704 host target gene. LOC58489 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC58489, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC58489 BINDING SITE, designated SEQ ID:35908, to the nucleotide sequence of VGAM1704 RNA, herein designated VGAM RNA, also designated SEQ ID:4415.

[57359] Another function of VGAM1704 is therefore inhibition of LOC58489 (Accession XM\_051862). Accordingly, utilities of VGAM1704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC58489. LOC90538 (Accession XM\_032401) is another VGAM1704 host target gene. LOC90538 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90538, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90538 BINDING SITE, designated SEQ ID:31659, to the nucleotide sequence of VGAM1704 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4415.

[57360] Another function of VGAM1704 is therefore inhibition of LOC90538 (Accession XM\_032401). Accordingly, utilities of VGAM1704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90538. LOC93132 (Accession XM\_049396) is another VGAM1704 host target gene. LOC93132 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC93132, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93132 BINDING SITE, designated SEQ ID:35411, to the nucleotide sequence of VGAM1704 RNA, herein designated VGAM RNA, also designated SEQ ID:4415.

[57361] Another function of VGAM1704 is therefore inhibition of LOC93132 (Accession XM\_049396). Accordingly, utilities of VGAM1704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93132. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1705 (VGAM1705) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[57362] VGAM1705 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1705 was detected is described hereinabove with reference to Figs. 1–8.

[57363] VGAM1705 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectocarpus Siliculosus Virus. VGAM1705 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[57364] VGAM1705 gene encodes a VGAM1705 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1705 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1705 precursor RNA is designated SEQ ID:1691, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1691 is located at position 51223 relative to the genome of Ectocarpus Siliculosus Virus.

[57365] VGAM1705 precursor RNA folds onto itself, forming

VGAM1705 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[57366] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1705 folded precursor RNA into VGAM1705 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1705 RNA is designated SEQ ID:4416, and is provided hereinbelow with reference to the sequence listing part.

[57367] VGAM1705 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1705 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1705 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[57368] VGAM1705 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1705 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1705 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1705 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1705 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[57369] The complementary binding of VGAM1705 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1705 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1705 host target RNA into VGAM1705 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[57370] It is appreciated that VGAM1705 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1705 host target genes. The mRNA of each one of this plurality of VGAM1705 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1705 RNA, herein designated VGAM RNA, and which when bound by VGAM1705 RNA causes inhibition of translation of respective one or more VGAM1705 host target proteins.

[57371] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1705 gene, herein designated VGAM GENE, on one or more VGAM1705 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[57372] It is yet further appreciated that a function of VGAM1705 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1705 include diagnosis, prevention and treatment of viral infection by Ectocarpus Siliculosus Virus. Specific functions, and accordingly utilities, of VGAM1705 correlate with, and may be deduced from, the identity of the host target genes which VGAM1705 binds

and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[57373] Nucleotide sequences of the VGAM1705 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1705 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1705 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1705 are further described hereinbelow with reference to Table 1.

[57374] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1705 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1705 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[57375] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1705 gene, herein designated VGAM is inhibition of expression of VGAM1705 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1705 correlate with, and may be deduced from, the identity of the target genes which VGAM1705 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[57376] Cystinosis, Nephropathic (CTNS, Accession NM\_004937) is a VGAM1705 host target gene. CTNS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CTNS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CTNS BINDING SITE, designated SEQ ID:11383, to the nucleotide sequence of VGAM1705 RNA, herein designated VGAM RNA, also designated SEQ ID:4416.

[57377] A function of VGAM1705 is therefore inhibition of Cystinosis, Nephropathic (CTNS, Accession NM\_004937). Accordingly, utilities of VGAM1705 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CTNS. Protein Kinase C, Nu (PRKCN, Accession NM\_005813) is another VGAM1705 host target gene. PRKCN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRKCN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRKCN BINDING SITE, designated SEQ

ID:12398, to the nucleotide sequence of VGAM1705 RNA, herein designated VGAM RNA, also designated SEQ ID:4416.

[57378] Another function of VGAM1705 is therefore inhibition of Protein Kinase C, Nu (PRKCN, Accession NM\_005813). Accordingly, utilities of VGAM1705 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKCN. Calcium/calmodulin-dependent Protein Kinase Kinase 1, Alpha (CAMKK1, Accession NM\_032294) is another VGAM1705 host target gene. CAMKK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAMKK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAMKK1 BINDING SITE, designated SEQ ID:26065, to the nucleotide sequence of VGAM1705 RNA, herein designated VGAM RNA, also designated SEQ ID:4416.

[57379] Another function of VGAM1705 is therefore inhibition of Calcium/calmodulin-dependent Protein Kinase Kinase 1, Alpha (CAMKK1, Accession NM\_032294). Accordingly, utilities of VGAM1705 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with CAMKK1. SYNE-2 (Accession NM\_015180) is another VGAM1705 host target gene. SYNE-2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SYNE-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYNE-2 BINDING SITE, designated SEQ ID:17535, to the nucleotide sequence of VGAM1705 RNA, herein designated VGAM RNA, also designated SEQ ID:4416.

[57380] Another function of VGAM1705 is therefore inhibition of SYNE-2 (Accession NM\_015180). Accordingly, utilities of VGAM1705 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYNE-2. ZF (Accession NM\_021212) is another VGAM1705 host target gene. ZF BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ZF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZF BINDING SITE, designated SEQ ID:22189, to the nucleotide sequence of VGAM1705 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4416.

[57381] Another function of VGAM1705 is therefore inhibition of ZF (Accession NM\_021212). Accordingly, utilities of VGAM1705 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZF. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1706 (VGAM1706) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[57382] VGAM1706 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1706 was detected is described hereinabove with reference to Figs. 1-8.

[57383] VGAM1706 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectocarpus Siliculosus Virus. VGAM1706 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[57384] VGAM1706 gene encodes a VGAM1706 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM1706 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1706 precursor RNA is designated SEQ ID:1692, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1692 is located at position 54780 relative to the genome of Ectocarpus Siliculosus Virus.

- [57385] VGAM1706 precursor RNA folds onto itself, forming VGAM1706 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [57386] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1706 folded precursor RNA into VGAM1706 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1706 RNA is designated SEQ ID:4417, and is provided hereinbelow with reference to the sequence listing part.

[57387] VGAM1706 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1706 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1706 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[57388] VGAM1706 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1706 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1706 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1706 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1706 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[57389] The complementary binding of VGAM1706 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1706 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1706 host target RNA into VGAM1706 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[57390] It is appreciated that VGAM1706 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1706 host target genes. The mRNA of each one of this plurality of VGAM1706 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1706 RNA, herein designated VGAM RNA, and which when bound by VGAM1706 RNA causes inhibition of translation of respective one or more VGAM1706 host target proteins.

[57391] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1706 gene, herein designated VGAM GENE, on one or more VGAM1706 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[57392] It is yet further appreciated that a function of VGAM1706 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1706 include diagnosis, prevention and treatment of viral infection by Ectocarpus Siliculosus Virus. Specific functions, and accordingly utilities, of VGAM1706 correlate with, and may be deduced from, the identity of the host target genes which VGAM1706 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[57393] Nucleotide sequences of the VGAM1706 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1706 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1706 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1706 are further described hereinbelow with reference to Table 1.

[57394] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1706 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1706 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[57395] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1706 gene, herein designated VGAM is inhibition of expression of VGAM1706 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1706 correlate with, and may be deduced from, the identity of the target genes which VGAM1706 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[57396] Ephrin-B2 (EFNB2, Accession NM\_004093) is a VGAM1706 host target gene. EFNB2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EFNB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EFNB2 BINDING SITE, designated SEQ ID:10297, to the nucleotide sequence of VGAM1706 RNA, herein designated VGAM RNA, also designated SEQ ID:4417.

[57397] A function of VGAM1706 is therefore inhibition of Ephrin-B2 (EFNB2, Accession NM\_004093). Accordingly, utilities of VGAM1706 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

EFNB2. Early Growth Response 1 (EGR1, Accession NM\_001964) is another VGAM1706 host target gene. EGR1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EGR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGR1 BINDING SITE, designated SEQ ID:7692, to the nucleotide sequence of VGAM1706 RNA, herein designated VGAM RNA, also designated SEQ ID:4417.

[57398] Another function of VGAM1706 is therefore inhibition of Early Growth Response 1 (EGR1, Accession NM\_001964). Accordingly, utilities of VGAM1706 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGR1. Fibroblast Growth Factor 2 (basic) (FGF2, Accession NM\_002006) is another VGAM1706 host target gene. FGF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FGF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGF2 BINDING SITE, designated SEQ ID:7744, to the nucleotide sequence of

VGAM1706 RNA, herein designated VGAM RNA, also designated SEQ ID:4417.

[57399] Another function of VGAM1706 is therefore inhibition of Fibroblast Growth Factor 2 (basic) (FGF2, Accession NM\_002006), a gene which probably involved in nervous system development and function. Accordingly, utilities of VGAM1706 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGF2. The function of FGF2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM51.5-hydroxytryptamine (serotonin) Receptor 2C (HTR2C, Accession NM\_000868) is another VGAM1706 host target gene. HTR2C BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HTR2C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HTR2C BINDING SITE, designated SEQ ID:6535, to the nucleotide sequence of VGAM1706 RNA, herein designated VGAM RNA, also designated SEQ ID:4417.

[57400] Another function of VGAM1706 is therefore inhibition of

5-hydroxytryptamine (serotonin) Receptor 2C (HTR2C, Accession NM\_000868), a gene which activates phospholipase C and regulates intracellular calcium flux. Accordingly, utilities of VGAM1706 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTR2C. The function of HTR2C and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1052.

Inositol 1,4,5-triphosphate Receptor, Type 3 (ITPR3, Accession NM\_002224) is another VGAM1706 host target gene.

ITPR3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITPR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITPR3 BINDING SITE, designated SEQ ID:7999, to the nucleotide sequence of VGAM1706 RNA, herein designated VGAM RNA, also designated SEQ ID:4417.

[57401] Another function of VGAM1706 is therefore inhibition of Inositol 1,4,5-triphosphate Receptor, Type 3 (ITPR3, Accession NM\_002224), a gene which may be responsible for calcium release from intracellular stores. Accordingly,

utilities of VGAM1706 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITPR3. The function of ITPR3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM310. Proteasome (prosome, macropain) Subunit, Beta Type, 2 (PSMB2, Accession NM\_002794) is another VGAM1706 host target gene. PSMB2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PSMB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSMB2 BINDING SITE, designated SEQ ID:8673, to the nucleotide sequence of VGAM1706 RNA, herein designated VGAM RNA, also designated SEQ ID:4417.

[57402] Another function of VGAM1706 is therefore inhibition of Proteasome (prosome, macropain) Subunit, Beta Type, 2 (PSMB2, Accession NM\_002794). Accordingly, utilities of VGAM1706 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSMB2. Calneuron 1 (CALN1, Accession NM\_031468) is another VGAM1706 host target gene. CALN1 BINDING SITE is HOST

TARGET binding site found in the 3` untranslated region of mRNA encoded by CALN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CALN1 BINDING SITE, designated SEQ ID:25519, to the nucleotide sequence of VGAM1706 RNA, herein designated VGAM RNA, also designated SEQ ID:4417.

[57403] Another function of VGAM1706 is therefore inhibition of Calneuron 1 (CALN1, Accession NM\_031468). Accordingly, utilities of VGAM1706 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CALN1. Calcium/calmodulin-dependent Protein Kinase Kinase 1, Alpha (CAMKK1, Accession NM\_032294) is another VGAM1706 host target gene. CAMKK1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CAMKK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAMKK1 BINDING SITE, designated SEQ ID:26068, to the nucleotide sequence of VGAM1706 RNA, herein designated VGAM RNA, also designated SEQ ID:4417.

[57404] Another function of VGAM1706 is therefore inhibition of Calcium/calmodulin-dependent Protein Kinase Kinase 1, Alpha (CAMKK1, Accession NM\_032294). Accordingly, utilities of VGAM1706 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAMKK1. DC-TM4F2 (Accession NM\_030927) is another VGAM1706 host target gene. DC-TM4F2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DC-TM4F2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DC-TM4F2 BINDING SITE, designated SEQ ID:25199, to the nucleotide sequence of VGAM1706 RNA, herein designated VGAM RNA, also designated SEQ ID:4417.

[57405] Another function of VGAM1706 is therefore inhibition of DC-TM4F2 (Accession NM\_030927). Accordingly, utilities of VGAM1706 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DC-TM4F2. DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 34 (DDX34, Accession NM\_014681) is another VGAM1706 host target gene. DDX34 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by DDX34, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDX34 BINDING SITE, designated SEQ ID:16169, to the nucleotide sequence of VGAM1706 RNA, herein designated VGAM RNA, also designated SEQ ID:4417.

[57406] Another function of VGAM1706 is therefore inhibition of DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 34 (DDX34, Accession NM\_014681). Accordingly, utilities of VGAM1706 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX34. DRIL2 (Accession NM\_006465) is another VGAM1706 host target gene. DRIL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DRIL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DRIL2 BINDING SITE, designated SEQ ID:13188, to the nucleotide sequence of VGAM1706 RNA, herein designated VGAM RNA, also designated SEQ ID:4417.

[57407] Another function of VGAM1706 is therefore inhibition of

DRIL2 (Accession NM\_006465). Accordingly, utilities of VGAM1706 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DRIL2. FLJ12294 (Accession NM\_025100) is another VGAM1706 host target gene. FLJ12294 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12294, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12294 BINDING SITE, designated SEQ ID:24743, to the nucleotide sequence of VGAM1706 RNA, herein designated VGAM RNA, also designated SEQ ID:4417.

[57408] Another function of VGAM1706 is therefore inhibition of FLJ12294 (Accession NM\_025100). Accordingly, utilities of VGAM1706 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12294. FLJ13456 (Accession XM\_038291) is another VGAM1706 host target gene. FLJ13456 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13456, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of FLJ13456 BINDING SITE, designated SEQ ID:32800, to the nucleotide sequence of VGAM1706 RNA, herein designated VGAM RNA, also designated SEQ ID:4417.

[57409] Another function of VGAM1706 is therefore inhibition of FLJ13456 (Accession XM\_038291). Accordingly, utilities of VGAM1706 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13456. FLJ20489 (Accession NM\_017842) is another VGAM1706 host target gene. FLJ20489 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ20489, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20489 BINDING SITE, designated SEQ ID:19507, to the nucleotide sequence of VGAM1706 RNA, herein designated VGAM RNA, also designated SEQ ID:4417.

[57410] Another function of VGAM1706 is therefore inhibition of FLJ20489 (Accession NM\_017842). Accordingly, utilities of VGAM1706 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20489. FLJ21551 (Accession NM\_024801) is another

VGAM1706 host target gene. FLJ21551 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21551, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21551 BINDING SITE, designated SEQ ID:24181, to the nucleotide sequence of VGAM1706 RNA, herein designated VGAM RNA, also designated SEQ ID:4417.

[57411] Another function of VGAM1706 is therefore inhibition of FLJ21551 (Accession NM\_024801). Accordingly, utilities of VGAM1706 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21551. FLJ22362 (Accession NM\_022823) is another VGAM1706 host target gene. FLJ22362 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ22362, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22362 BINDING SITE, designated SEQ ID:23105, to the nucleotide sequence of VGAM1706 RNA, herein designated VGAM RNA, also designated SEQ ID:4417.

[57412] Another function of VGAM1706 is therefore inhibition of FLJ22362 (Accession NM\_022823). Accordingly, utilities of VGAM1706 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22362. FLJ22692 (Accession NM\_025049) is another VGAM1706 host target gene. FLJ22692 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22692, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22692 BINDING SITE, designated SEQ ID:24644, to the nucleotide sequence of VGAM1706 RNA, herein designated VGAM RNA, also designated SEQ ID:4417.

[57413] Another function of VGAM1706 is therefore inhibition of FLJ22692 (Accession NM\_025049). Accordingly, utilities of VGAM1706 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22692. FLJ23598 (Accession XM\_170689) is another VGAM1706 host target gene. FLJ23598 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ23598, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23598 BINDING SITE, designated SEQ ID:45468, to the nucleotide sequence of VGAM1706 RNA, herein designated VGAM RNA, also designated SEQ ID:4417.

[57414] Another function of VGAM1706 is therefore inhibition of FLJ23598 (Accession XM\_170689). Accordingly, utilities of VGAM1706 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23598. KIAA0795 (Accession NM\_025010) is another VGAM1706 host target gene. KIAA0795 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0795, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0795 BINDING SITE, designated SEQ ID:24588, to the nucleotide sequence of VGAM1706 RNA, herein designated VGAM RNA, also designated SEQ ID:4417.

[57415] Another function of VGAM1706 is therefore inhibition of KIAA0795 (Accession NM\_025010). Accordingly, utilities of VGAM1706 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0795. KIAA1872 (Accession XM\_031917) is another VGAM1706 host target gene. KIAA1872 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1872, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1872 BINDING SITE, designated SEQ ID:31518, to the nucleotide sequence of VGAM1706 RNA, herein designated VGAM RNA, also designated SEQ ID:4417.

[57416] Another function of VGAM1706 is therefore inhibition of KIAA1872 (Accession XM\_031917). Accordingly, utilities of VGAM1706 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1872. LGP1 (Accession NM\_032484) is another VGAM1706 host target gene. LGP1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LGP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LGP1 BINDING SITE, designated SEQ ID:26232, to the nucleotide sequence of VGAM1706 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4417.

[57417] Another function of VGAM1706 is therefore inhibition of LGP1 (Accession NM\_032484). Accordingly, utilities of VGAM1706 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LGP1. Mitogen-activated Protein Kinase Kinase 4 (MAP2K4, Accession NM\_003010) is another VGAM1706 host target gene. MAP2K4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAP2K4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP2K4 BINDING SITE, designated SEQ ID:8917, to the nucleotide sequence of VGAM1706 RNA, herein designated VGAM RNA, also designated SEQ ID:4417.

[57418] Another function of VGAM1706 is therefore inhibition of Mitogen-activated Protein Kinase Kinase 4 (MAP2K4, Accession NM\_003010). Accordingly, utilities of VGAM1706 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP2K4. MGC29891 (Accession NM\_144618) is another VGAM1706 host target gene. MGC29891 BINDING SITE is HOST TAR-

GET binding site found in the 3' untranslated region of mRNA encoded by MGC29891, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC29891 BINDING SITE, designated SEQ ID:29438, to the nucleotide sequence of VGAM1706 RNA, herein designated VGAM RNA, also designated SEQ ID:4417.

[57419] Another function of VGAM1706 is therefore inhibition of MGC29891 (Accession NM\_144618). Accordingly, utilities of VGAM1706 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC29891. Nup43 (Accession NM\_024647) is another VGAM1706 host target gene. Nup43 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by Nup43, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Nup43 BINDING SITE, designated SEQ ID:23937, to the nucleotide sequence of VGAM1706 RNA, herein designated VGAM RNA, also designated SEQ ID:4417.

[57420] Another function of VGAM1706 is therefore inhibition of

Nup43 (Accession NM\_024647). Accordingly, utilities of VGAM1706 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Nup43. Neurexophilin 3 (NXPH3, Accession XM\_037847) is another VGAM1706 host target gene. NXPH3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NXPH3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NXPH3 BINDING SITE, designated SEQ ID:32715, to the nucleotide sequence of VGAM1706 RNA, herein designated VGAM RNA, also designated SEQ ID:4417.

[57421] Another function of VGAM1706 is therefore inhibition of Neurexophilin 3 (NXPH3, Accession XM\_037847). Accordingly, utilities of VGAM1706 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NXPH3. Regulator of G-protein Signalling 11 (RGS11, Accession NM\_003834) is another VGAM1706 host target gene. RGS11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RGS11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RGS11 BINDING SITE, designated SEQ ID:9925, to the nucleotide sequence of VGAM1706 RNA, herein designated VGAM RNA, also designated SEQ ID:4417.

[57422] Another function of VGAM1706 is therefore inhibition of Regulator of G-protein Signalling 11 (RGS11, Accession NM\_003834). Accordingly, utilities of VGAM1706 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RGS11. ZAK (Accession NM\_133646) is another VGAM1706 host target gene. ZAK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZAK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZAK BINDING SITE, designated SEQ ID:28606, to the nucleotide sequence of VGAM1706 RNA, herein designated VGAM RNA, also designated SEQ ID:4417.

[57423] Another function of VGAM1706 is therefore inhibition of ZAK (Accession NM\_133646). Accordingly, utilities of VGAM1706 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZAK.

LOC115129 (Accession XM\_055292) is another VGAM1706 host target gene. LOC115129 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC115129, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115129 BINDING SITE, designated SEQ ID:36255, to the nucleotide sequence of VGAM1706 RNA, herein designated VGAM RNA, also designated SEQ ID:4417.

[57424] Another function of VGAM1706 is therefore inhibition of LOC115129 (Accession XM\_055292). Accordingly, utilities of VGAM1706 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115129. LOC115330 (Accession NM\_138445) is another VGAM1706 host target gene. LOC115330 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC115330, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115330 BINDING SITE, designated SEQ ID:28811, to the nucleotide sequence of VGAM1706 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4417.

[57425] Another function of VGAM1706 is therefore inhibition of LOC115330 (Accession NM\_138445). Accordingly, utilities of VGAM1706 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115330. LOC116437 (Accession XM\_058185) is another VGAM1706 host target gene. LOC116437 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC116437, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC116437 BINDING SITE, designated SEQ ID:36582, to the nucleotide sequence of VGAM1706 RNA, herein designated VGAM RNA, also designated SEQ ID:4417.

[57426] Another function of VGAM1706 is therefore inhibition of LOC116437 (Accession XM\_058185). Accordingly, utilities of VGAM1706 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116437. LOC145955 (Accession XM\_096912) is another VGAM1706 host target gene. LOC145955 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145955, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145955 BINDING SITE, designated SEQ ID:40644, to the nucleotide sequence of VGAM1706 RNA, herein designated VGAM RNA, also designated SEQ ID:4417.

[57427] Another function of VGAM1706 is therefore inhibition of LOC145955 (Accession XM\_096912). Accordingly, utilities of VGAM1706 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145955. LOC148147 (Accession XM\_086071) is another VGAM1706 host target gene. LOC148147 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148147, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148147 BINDING SITE, designated SEQ ID:38477, to the nucleotide sequence of VGAM1706 RNA, herein designated VGAM RNA, also designated SEQ ID:4417.

[57428] Another function of VGAM1706 is therefore inhibition of LOC148147 (Accession XM\_086071). Accordingly, utilities of VGAM1706 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC148147. LOC149460 (Accession XM\_097652) is another VGAM1706 host target gene. LOC149460 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149460, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149460 BINDING SITE, designated SEQ ID:40998, to the nucleotide sequence of VGAM1706 RNA, herein designated VGAM RNA, also designated SEQ ID:4417.

[57429] Another function of VGAM1706 is therefore inhibition of LOC149460 (Accession XM\_097652). Accordingly, utilities of VGAM1706 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149460. LOC158819 (Accession XM\_098995) is another VGAM1706 host target gene. LOC158819 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158819, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158819 BINDING SITE, designated SEQ ID:42029, to

the nucleotide sequence of VGAM1706 RNA, herein designated VGAM RNA, also designated SEQ ID:4417.

[57430] Another function of VGAM1706 is therefore inhibition of LOC158819 (Accession XM\_098995). Accordingly, utilities of VGAM1706 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158819. LOC169026 (Accession XM\_095471) is another VGAM1706 host target gene. LOC169026 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC169026, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC169026 BINDING SITE, designated SEQ ID:40269, to the nucleotide sequence of VGAM1706 RNA, herein designated VGAM RNA, also designated SEQ ID:4417.

[57431] Another function of VGAM1706 is therefore inhibition of LOC169026 (Accession XM\_095471). Accordingly, utilities of VGAM1706 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC169026. LOC196955 (Accession XM\_085210) is another VGAM1706 host target gene. LOC196955 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC196955, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196955 BINDING SITE, designated SEQ ID:37931, to the nucleotide sequence of VGAM1706 RNA, herein designated VGAM RNA, also designated SEQ ID:4417.

[57432] Another function of VGAM1706 is therefore inhibition of LOC196955 (Accession XM\_085210). Accordingly, utilities of VGAM1706 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196955. LOC199678 (Accession XM\_117111) is another VGAM1706 host target gene. LOC199678 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199678, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199678 BINDING SITE, designated SEQ ID:43227, to the nucleotide sequence of VGAM1706 RNA, herein designated VGAM RNA, also designated SEQ ID:4417.

[57433] Another function of VGAM1706 is therefore inhibition of LOC199678 (Accession XM\_117111). Accordingly, utilities

of VGAM1706 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199678. LOC58489 (Accession XM\_051862) is another VGAM1706 host target gene. LOC58489 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC58489, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC58489 BINDING SITE, designated SEQ ID:35908, to the nucleotide sequence of VGAM1706 RNA, herein designated VGAM RNA, also designated SEQ ID:4417.

[57434] Another function of VGAM1706 is therefore inhibition of LOC58489 (Accession XM\_051862). Accordingly, utilities of VGAM1706 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC58489. LOC90538 (Accession XM\_032401) is another VGAM1706 host target gene. LOC90538 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90538, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC90538 BINDING SITE, designated SEQ ID:31659, to the nucleotide sequence of VGAM1706 RNA, herein designated VGAM RNA, also designated SEQ ID:4417.

[57435] Another function of VGAM1706 is therefore inhibition of LOC90538 (Accession XM\_032401). Accordingly, utilities of VGAM1706 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90538. LOC93132 (Accession XM\_049396) is another VGAM1706 host target gene. LOC93132 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC93132, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93132 BINDING SITE, designated SEQ ID:35411, to the nucleotide sequence of VGAM1706 RNA, herein designated VGAM RNA, also designated SEQ ID:4417.

[57436] Another function of VGAM1706 is therefore inhibition of LOC93132 (Accession XM\_049396). Accordingly, utilities of VGAM1706 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93132. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 1707 (VGAM1707) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[57437] VGAM1707 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1707 was detected is described hereinabove with reference to Figs. 1–8.

[57438] VGAM1707 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectocarpus Siliculosus Virus. VGAM1707 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[57439] VGAM1707 gene encodes a VGAM1707 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1707 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1707 precursor RNA is designated SEQ ID:1693, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1693 is located at position 48576 relative to the

genome of Ectocarpus Siliculosus Virus.

[57440] VGAM1707 precursor RNA folds onto itself, forming VGAM1707 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[57441] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1707 folded precursor RNA into VGAM1707 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 61%) nucleotide sequence of VGAM1707 RNA is designated SEQ ID:4418, and is provided hereinbelow with reference to the sequence listing part.

[57442] VGAM1707 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1707 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1707 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[57443] VGAM1707 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1707 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1707 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1707 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1707 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[57444] The complementary binding of VGAM1707 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1707 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1707 host target RNA into VGAM1707 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[57445] It is appreciated that VGAM1707 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1707 host target genes. The mRNA of each one of this plurality of VGAM1707 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1707 RNA, herein designated VGAM RNA, and which when bound by VGAM1707 RNA causes inhibition of translation of respective one or more VGAM1707 host target proteins.

[57446] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1707 gene, herein designated VGAM GENE, on one or more VGAM1707 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[57447] It is yet further appreciated that a function of VGAM1707 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1707 include diagnosis, prevention and treatment of viral infection by Ectocarpus Siliculosus Virus. Specific functions, and accordingly utilities, of

VGAM1707 correlate with, and may be deduced from, the identity of the host target genes which VGAM1707 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[57448] Nucleotide sequences of the VGAM1707 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1707 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1707 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1707 are further described hereinbelow with reference to Table 1.

[57449] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1707 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1707 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[57450] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1707 gene, herein designated VGAM is inhibition of expression of VGAM1707 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1707 correlate with, and may be deduced

from, the identity of the target genes which VGAM1707 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[57451] Amiloride-sensitive Cation Channel 2, Neuronal (ACCN2, Accession NM\_020039) is a VGAM1707 host target gene. ACCN2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ACCN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACCN2 BINDING SITE, designated SEQ ID:21296, to the nucleotide sequence of VGAM1707 RNA, herein designated VGAM RNA, also designated SEQ ID:4418.

[57452] A function of VGAM1707 is therefore inhibition of Amiloride-sensitive Cation Channel 2, Neuronal (ACCN2, Accession NM\_020039). Accordingly, utilities of VGAM1707 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACCN2. Acetylcholinesterase (YT blood group) (ACHE, Accession NM\_015831) is another VGAM1707 host target gene. ACHE BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ACHE,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACHE BINDING SITE, designated SEQ ID:17943, to the nucleotide sequence of VGAM1707 RNA, herein designated VGAM RNA, also designated SEQ ID:4418.

[57453] Another function of VGAM1707 is therefore inhibition of Acetylcholinesterase (YT blood group) (ACHE, Accession NM\_015831), a gene which rapidly hydrolyzes choline released into the synapse. Accordingly, utilities of VGAM1707 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACHE. The function of ACHE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1020. Beta-1,3-glucuronyltransferase 1 (glucuronosyltransferase P) (B3GAT1, Accession NM\_018644) is another VGAM1707 host target gene. B3GAT1 BINDING SITE1 and B3GAT1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by B3GAT1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the comple-

mentarity of the nucleotide sequences of B3GAT1 BINDING SITE1 and B3GAT1 BINDING SITE2, designated SEQ ID:20717 and SEQ ID:27629 respectively, to the nucleotide sequence of VGAM1707 RNA, herein designated VGAM RNA, also designated SEQ ID:4418.

[57454] Another function of VGAM1707 is therefore inhibition of Beta-1,3-glucuronyltransferase 1 (glucuronosyltransferase P) (B3GAT1, Accession NM\_018644). Accordingly, utilities of VGAM1707 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B3GAT1. G1 to S Phase Transition 1 (GSPT1, Accession NM\_002094) is another VGAM1707 host target gene. GSPT1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GSPT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GSPT1 BINDING SITE, designated SEQ ID:7882, to the nucleotide sequence of VGAM1707 RNA, herein designated VGAM RNA, also designated SEQ ID:4418.

[57455] Another function of VGAM1707 is therefore inhibition of G1 to S Phase Transition 1 (GSPT1, Accession

NM\_002094), a gene which involves in regulation of mammalian cell growth. Accordingly, utilities of VGAM1707 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GSPT1. The function of GSPT1 has been established by previous studies. Kikuchi et al. (1988) isolated a gene from a yeast genomic library that could complement a temperature-sensitive mutant of *Saccharomyces cerevisiae*. The gene, termed GST1, seemed to be essential for the G1-to-S phase transition in the yeast cell cycle. The gene product appeared to be a GTP-binding protein of molecular mass 76,565 Da, with 38% identity in amino acid sequence with the alpha subunit of elongation factor-1 (OMIM Ref. No. 130590). Hoshino et al. (1989) cloned the human equivalent from a cDNA library. By nonradioactive in situ hybridization, Ozawa et al. (1992) mapped the GSPT1 gene, the human homolog of the yeast gene GST1-Hs, to human chromosome 16p13.1. Southern blot hybridization with a panel of human-rodent somatic cells confirmed the localization of the GSPT1 gene on chromosome 16 and also showed the existence of a homologous gene on the X chromosome. They pointed out that a breakpoint for non-random chromosome rearrangements has been found in

the region of GSPT1 in patients with acute nonlymphocytic leukemia.

[57456] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[57457] Ozawa, K.; Murakami, Y.; Eki, T.; Yokoyama, K.; Soeda, E.; Hoshino, S.; Ui, M.; Hanaoka, F. : Mapping of the human GSPT1 gene, a human homolog of the yeast GST1 gene, to chromosomal band 16p13.1. Somat. Cell Molec. Genet. 18: 189–194, 1992. ; and

[57458] Hoshino, S.; Miyazawa, H.; Enomoto, T.; Hanaoka, F.; Kikuchi, Y.; Kikuchi, A.; Ui, M. : A human homologue of the yeast GST1 gene codes for a GTP-binding protein and is expressed in a pro.

[57459] Further studies establishing the function and utilities of GSPT1 are found in John Hopkins OMIM database record ID 139259, and in cited publications numbered 1883–1885 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Potassium Channel, Subfamily K, Member 4 (KCNK4, Accession NM\_016611) is another VGAM1707 host target gene. KCNK4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

KCNK4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNK4 BINDING SITE, designated SEQ ID:18715, to the nucleotide sequence of VGAM1707 RNA, herein designated VGAM RNA, also designated SEQ ID:4418.

[57460] Another function of VGAM1707 is therefore inhibition of Potassium Channel, Subfamily K, Member 4 (KCNK4, Accession NM\_016611). Accordingly, utilities of VGAM1707 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNK4. KIP2 (Accession NM\_006383) is another VGAM1707 host target gene. KIP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIP2 BINDING SITE, designated SEQ ID:13088, to the nucleotide sequence of VGAM1707 RNA, herein designated VGAM RNA, also designated SEQ ID:4418.

[57461] Another function of VGAM1707 is therefore inhibition of KIP2 (Accession NM\_006383). Accordingly, utilities of

VGAM1707 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIP2. Mel Transforming Oncogene (derived from cell line NK14)– RAB8 Homolog (MEL, Accession NM\_005370) is another VGAM1707 host target gene. MEL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MEL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEL BINDING SITE, designated SEQ ID:11844, to the nucleotide sequence of VGAM1707 RNA, herein designated VGAM RNA, also designated SEQ ID:4418.

[57462] Another function of VGAM1707 is therefore inhibition of Mel Transforming Oncogene (derived from cell line NK14)– RAB8 Homolog (MEL, Accession NM\_005370), a gene which may be involved in vesicular trafficking and neurotransmitter release. Accordingly, utilities of VGAM1707 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEL. The function of MEL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to VGAM40.Matrix Metalloproteinase 15

(membrane-inserted) (MMP15, Accession NM\_002428) is another VGAM1707 host target gene. MMP15 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MMP15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MMP15 BINDING SITE, designated SEQ ID:8262, to the nucleotide sequence of VGAM1707 RNA, herein designated VGAM RNA, also designated SEQ ID:4418.

[57463] Another function of VGAM1707 is therefore inhibition of Matrix Metalloproteinase 15 (membrane-inserted) (MMP15, Accession NM\_002428). Accordingly, utilities of VGAM1707 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MMP15. Neurogranin (protein kinase C substrate, RC3) (NRGN, Accession NM\_006176) is another VGAM1707 host target gene. NRGN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NRGN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of NRGN BINDING SITE, designated SEQ ID:12836, to the nucleotide sequence of VGAM1707 RNA, herein designated VGAM RNA, also designated SEQ ID:4418.

[57464] Another function of VGAM1707 is therefore inhibition of Neurogranin (protein kinase C substrate, RC3) (NRGN, Accession NM\_006176), a gene which acts as a "third messenger" substrate of protein kinase c-mediated molecular cascades during synaptic development and remodeling. Accordingly, utilities of VGAM1707 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NRGN. The function of NRGN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1677. Neurexin 2 (NRXN2, Accession NM\_015080) is another VGAM1707 host target gene. NRXN2 BINDING SITE1 through NRXN2 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by NRXN2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NRXN2 BINDING SITE1 through NRXN2 BINDING SITE3,

designated SEQ ID:17467, SEQ ID:28983 and SEQ ID:28989 respectively, to the nucleotide sequence of VGAM1707 RNA, herein designated VGAM RNA, also designated SEQ ID:4418.

[57465] Another function of VGAM1707 is therefore inhibition of Neurexin 2 (NRXN2, Accession NM\_015080), a gene which may be involved in cell recognition, cell adhesion, and may mediate intracellular signaling. Accordingly, utilities of VGAM1707 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NRXN2. The function of NRXN2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM178. Stearoyl-CoA Desaturase (delta-9-desaturase) (SCD, Accession NM\_005063) is another VGAM1707 host target gene. SCD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCD BINDING SITE, designated SEQ ID:11496, to the nucleotide sequence of VGAM1707 RNA, herein designated VGAM RNA,

also designated SEQ ID:4418.

[57466] Another function of VGAM1707 is therefore inhibition of Stearoyl-CoA Desaturase (delta-9-desaturase) (SCD, Accession NM\_005063), a gene which functions in the synthesis of unsaturated fatty acids. Accordingly, utilities of VGAM1707 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCD. The function of SCD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM314. Staufen, RNA Binding Protein (Drosophila) (STAU, Accession NM\_004602) is another VGAM1707 host target gene. STAU BINDING SITE1 through STAU BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by STAU, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STAU BINDING SITE1 through STAU BINDING SITE4, designated SEQ ID:10944, SEQ ID:18928, SEQ ID:18916 and SEQ ID:18922 respectively, to the nucleotide sequence of VGAM1707 RNA, herein designated VGAM RNA, also designated SEQ ID:4418.

[57467] Another function of VGAM1707 is therefore inhibition of Staufen, RNA Binding Protein (Drosophila) (STAU, Accession NM\_004602), a gene which may play a role in specific positioning of mrnas at given sites in the cell and in stimulating their translation at the site. Accordingly, utilities of VGAM1707 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STAU. The function of STAU and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM916. Transcription Factor Binding to IGHM Enhancer 3 (TFE3, Accession NM\_006521) is another VGAM1707 host target gene. TFE3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TFE3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TFE3 BINDING SITE, designated SEQ ID:13276, to the nucleotide sequence of VGAM1707 RNA, herein designated VGAM RNA, also designated SEQ ID:4418.

[57468] Another function of VGAM1707 is therefore inhibition of Transcription Factor Binding to IGHM Enhancer 3 (TFE3,

Accession NM\_006521), a gene which is a positive-acting transcription factor that binds to the immunoglobulin enhancer  $\mu$ 3 motif. Accordingly, utilities of VGAM1707 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TFE3. The function of TFE3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM443. Chromosome 1 Open Reading Frame 2 (C1orf2, Accession NM\_006589) is another VGAM1707 host target gene. C1orf2 BINDING SITE1 and C1orf2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by C1orf2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf2 BINDING SITE1 and C1orf2 BINDING SITE2, designated SEQ ID:13355 and SEQ ID:45395 respectively, to the nucleotide sequence of VGAM1707 RNA, herein designated VGAM RNA, also designated SEQ ID:4418.

[57469] Another function of VGAM1707 is therefore inhibition of Chromosome 1 Open Reading Frame 2 (C1orf2, Accession NM\_006589). Accordingly, utilities of VGAM1707 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf2. Centaurin, Beta 5 (CENTB5, Accession XM\_170937) is another VGAM1707 host target gene. CENTB5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CENTB5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CENTB5 BINDING SITE, designated SEQ ID:45726, to the nucleotide sequence of VGAM1707 RNA, herein designated VGAM RNA, also designated SEQ ID:4418.

[57470] Another function of VGAM1707 is therefore inhibition of Centaurin, Beta 5 (CENTB5, Accession XM\_170937). Accordingly, utilities of VGAM1707 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CENTB5. Carbohydrate (chondroitin 6) Sulfotransferase 3 (CHST3, Accession NM\_004273) is another VGAM1707 host target gene. CHST3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CHST3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of CHST3 BINDING SITE, designated SEQ ID:10479, to the nucleotide sequence of VGAM1707 RNA, herein designated VGAM RNA, also designated SEQ ID:4418.

[57471] Another function of VGAM1707 is therefore inhibition of Carbohydrate (chondroitin 6) Sulfotransferase 3 (CHST3, Accession NM\_004273). Accordingly, utilities of VGAM1707 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHST3. DKFZP586M1120 (Accession NM\_031294) is another VGAM1707 host target gene. DKFZP586M1120 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP586M1120, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP586M1120 BINDING SITE, designated SEQ ID:25319, to the nucleotide sequence of VGAM1707 RNA, herein designated VGAM RNA, also designated SEQ ID:4418.

[57472] Another function of VGAM1707 is therefore inhibition of DKFZP586M1120 (Accession NM\_031294). Accordingly, utilities of VGAM1707 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with DKFZP586M1120. Fatty Acid Desaturase 1 (FADS1, Accession NM\_013402) is another VGAM1707 host target gene. FADS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FADS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FADS1 BINDING SITE, designated SEQ ID:15068, to the nucleotide sequence of VGAM1707 RNA, herein designated VGAM RNA, also designated SEQ ID:4418.

[57473] Another function of VGAM1707 is therefore inhibition of Fatty Acid Desaturase 1 (FADS1, Accession NM\_013402). Accordingly, utilities of VGAM1707 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FADS1. FLJ13310 (Accession NM\_025118) is another VGAM1707 host target gene. FLJ13310 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13310, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of FLJ13310 BINDING SITE, designated SEQ ID:24767, to the nucleotide sequence of VGAM1707 RNA, herein designated VGAM RNA, also designated SEQ ID:4418.

[57474] Another function of VGAM1707 is therefore inhibition of FLJ13310 (Accession NM\_025118). Accordingly, utilities of VGAM1707 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13310. FLJ14251 (Accession NM\_024881) is another VGAM1707 host target gene. FLJ14251 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14251, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14251 BINDING SITE, designated SEQ ID:24326, to the nucleotide sequence of VGAM1707 RNA, herein designated VGAM RNA, also designated SEQ ID:4418.

[57475] Another function of VGAM1707 is therefore inhibition of FLJ14251 (Accession NM\_024881). Accordingly, utilities of VGAM1707 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14251. FLJ21839 (Accession NM\_021831) is another

VGAM1707 host target gene. FLJ21839 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21839, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21839 BINDING SITE, designated SEQ ID:22406, to the nucleotide sequence of VGAM1707 RNA, herein designated VGAM RNA, also designated SEQ ID:4418.

[57476] Another function of VGAM1707 is therefore inhibition of FLJ21839 (Accession NM\_021831). Accordingly, utilities of VGAM1707 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21839. HRD1 (Accession XM\_045498) is another VGAM1707 host target gene. HRD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HRD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HRD1 BINDING SITE, designated SEQ ID:34470, to the nucleotide sequence of VGAM1707 RNA, herein designated VGAM RNA, also designated SEQ ID:4418.

[57477] Another function of VGAM1707 is therefore inhibition of HRD1 (Accession XM\_045498). Accordingly, utilities of VGAM1707 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HRD1. HU-K4 (Accession NM\_012268) is another VGAM1707 host target gene. HU-K4 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HU-K4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HU-K4 BINDING SITE, designated SEQ ID:14590, to the nucleotide sequence of VGAM1707 RNA, herein designated VGAM RNA, also designated SEQ ID:4418.

[57478] Another function of VGAM1707 is therefore inhibition of HU-K4 (Accession NM\_012268). Accordingly, utilities of VGAM1707 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HU-K4. KIAA0082 (Accession XM\_166400) is another VGAM1707 host target gene. KIAA0082 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0082, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0082 BINDING SITE, designated SEQ ID:44263, to the nucleotide sequence of VGAM1707 RNA, herein designated VGAM RNA, also designated SEQ ID:4418.

[57479] Another function of VGAM1707 is therefore inhibition of KIAA0082 (Accession XM\_166400). Accordingly, utilities of VGAM1707 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0082. KIAA0429 (Accession NM\_014751) is another VGAM1707 host target gene. KIAA0429 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0429, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0429 BINDING SITE, designated SEQ ID:16468, to the nucleotide sequence of VGAM1707 RNA, herein designated VGAM RNA, also designated SEQ ID:4418.

[57480] Another function of VGAM1707 is therefore inhibition of KIAA0429 (Accession NM\_014751). Accordingly, utilities of VGAM1707 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0429. KIAA1240 (Accession XM\_039676) is another VGAM1707 host target gene. KIAA1240 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1240, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1240 BINDING SITE, designated SEQ ID:33142, to the nucleotide sequence of VGAM1707 RNA, herein designated VGAM RNA, also designated SEQ ID:4418.

[57481] Another function of VGAM1707 is therefore inhibition of KIAA1240 (Accession XM\_039676). Accordingly, utilities of VGAM1707 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1240. KIAA1719 (Accession XM\_042936) is another VGAM1707 host target gene. KIAA1719 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1719, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1719 BINDING SITE, designated SEQ ID:33817, to the nucleotide sequence of VGAM1707 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4418.

[57482] Another function of VGAM1707 is therefore inhibition of KIAA1719 (Accession XM\_042936). Accordingly, utilities of VGAM1707 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1719. KIAA1854 (Accession XM\_049884) is another VGAM1707 host target gene. KIAA1854 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1854, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1854 BINDING SITE, designated SEQ ID:35528, to the nucleotide sequence of VGAM1707 RNA, herein designated VGAM RNA, also designated SEQ ID:4418.

[57483] Another function of VGAM1707 is therefore inhibition of KIAA1854 (Accession XM\_049884). Accordingly, utilities of VGAM1707 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1854. KIAA1855 (Accession XM\_166453) is another VGAM1707 host target gene. KIAA1855 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1855, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1855 BINDING SITE, designated SEQ ID:44354, to the nucleotide sequence of VGAM1707 RNA, herein designated VGAM RNA, also designated SEQ ID:4418.

[57484] Another function of VGAM1707 is therefore inhibition of KIAA1855 (Accession XM\_166453). Accordingly, utilities of VGAM1707 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1855. MGC4796 (Accession XM\_029031) is another VGAM1707 host target gene. MGC4796 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4796, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4796 BINDING SITE, designated SEQ ID:30834, to the nucleotide sequence of VGAM1707 RNA, herein designated VGAM RNA, also designated SEQ ID:4418.

[57485] Another function of VGAM1707 is therefore inhibition of MGC4796 (Accession XM\_029031). Accordingly, utilities of VGAM1707 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with MGC4796. NET-7 (Accession NM\_012339) is another VGAM1707 host target gene. NET-7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NET-7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NET-7 BINDING SITE, designated SEQ ID:14735, to the nucleotide sequence of VGAM1707 RNA, herein designated VGAM RNA, also designated SEQ ID:4418.

[57486] Another function of VGAM1707 is therefore inhibition of NET-7 (Accession NM\_012339). Accordingly, utilities of VGAM1707 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NET-7. Protein Kinase, Lysine Deficient 2 (PRKWINK2, Accession XM\_117531) is another VGAM1707 host target gene. PRKWINK2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRKWINK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRKWINK2 BINDING SITE, designated SEQ

ID:43517, to the nucleotide sequence of VGAM1707 RNA, herein designated VGAM RNA, also designated SEQ ID:4418.

[57487] Another function of VGAM1707 is therefore inhibition of Protein Kinase, Lysine Deficient 2 (PRKWNK2, Accession XM\_117531). Accordingly, utilities of VGAM1707 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKWNK2. Septin 3 (SEPT3, Accession NM\_019106) is another VGAM1707 host target gene. SEPT3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEPT3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEPT3 BINDING SITE, designated SEQ ID:21183, to the nucleotide sequence of VGAM1707 RNA, herein designated VGAM RNA, also designated SEQ ID:4418.

[57488] Another function of VGAM1707 is therefore inhibition of Septin 3 (SEPT3, Accession NM\_019106). Accordingly, utilities of VGAM1707 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEPT3. LOC114932 (Accession XM\_052614) is an–

other VGAM1707 host target gene. LOC114932 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC114932, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC114932 BINDING SITE, designated SEQ ID:36008, to the nucleotide sequence of VGAM1707 RNA, herein designated VGAM RNA, also designated SEQ ID:4418.

[57489] Another function of VGAM1707 is therefore inhibition of LOC114932 (Accession XM\_052614). Accordingly, utilities of VGAM1707 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC114932. LOC115708 (Accession XM\_056552) is another VGAM1707 host target gene. LOC115708 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC115708, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115708 BINDING SITE, designated SEQ ID:36404, to the nucleotide sequence of VGAM1707 RNA, herein designated VGAM RNA, also designated SEQ ID:4418.

[57490] Another function of VGAM1707 is therefore inhibition of LOC115708 (Accession XM\_056552). Accordingly, utilities of VGAM1707 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115708. LOC131034 (Accession NM\_130808) is another VGAM1707 host target gene. LOC131034 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC131034, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC131034 BINDING SITE, designated SEQ ID:28315, to the nucleotide sequence of VGAM1707 RNA, herein designated VGAM RNA, also designated SEQ ID:4418.

[57491] Another function of VGAM1707 is therefore inhibition of LOC131034 (Accession NM\_130808). Accordingly, utilities of VGAM1707 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC131034. LOC145082 (Accession XM\_096719) is another VGAM1707 host target gene. LOC145082 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145082, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145082 BINDING SITE, designated SEQ ID:40493, to the nucleotide sequence of VGAM1707 RNA, herein designated VGAM RNA, also designated SEQ ID:4418.

[57492] Another function of VGAM1707 is therefore inhibition of LOC145082 (Accession XM\_096719). Accordingly, utilities of VGAM1707 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145082. LOC145371 (Accession XM\_085123) is another VGAM1707 host target gene. LOC145371 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145371, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145371 BINDING SITE, designated SEQ ID:37844, to the nucleotide sequence of VGAM1707 RNA, herein designated VGAM RNA, also designated SEQ ID:4418.

[57493] Another function of VGAM1707 is therefore inhibition of LOC145371 (Accession XM\_085123). Accordingly, utilities of VGAM1707 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC145371. LOC146268 (Accession XM\_085397) is another VGAM1707 host target gene. LOC146268 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146268, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146268 BINDING SITE, designated SEQ ID:38121, to the nucleotide sequence of VGAM1707 RNA, herein designated VGAM RNA, also designated SEQ ID:4418.

[57494] Another function of VGAM1707 is therefore inhibition of LOC146268 (Accession XM\_085397). Accordingly, utilities of VGAM1707 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146268. LOC148530 (Accession XM\_097480) is another VGAM1707 host target gene. LOC148530 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148530, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148530 BINDING SITE, designated SEQ ID:40888, to the nucleotide sequence of VGAM1707 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4418.

[57495] Another function of VGAM1707 is therefore inhibition of LOC148530 (Accession XM\_097480). Accordingly, utilities of VGAM1707 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148530. LOC150538 (Accession XM\_086945) is another VGAM1707 host target gene. LOC150538 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150538, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150538 BINDING SITE, designated SEQ ID:38990, to the nucleotide sequence of VGAM1707 RNA, herein designated VGAM RNA, also designated SEQ ID:4418.

[57496] Another function of VGAM1707 is therefore inhibition of LOC150538 (Accession XM\_086945). Accordingly, utilities of VGAM1707 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150538. LOC157922 (Accession XM\_098841) is another VGAM1707 host target gene. LOC157922 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157922, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157922 BINDING SITE, designated SEQ ID:41891, to the nucleotide sequence of VGAM1707 RNA, herein designated VGAM RNA, also designated SEQ ID:4418.

[57497] Another function of VGAM1707 is therefore inhibition of LOC157922 (Accession XM\_098841). Accordingly, utilities of VGAM1707 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157922. LOC158722 (Accession XM\_088653) is another VGAM1707 host target gene. LOC158722 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158722, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158722 BINDING SITE, designated SEQ ID:39890, to the nucleotide sequence of VGAM1707 RNA, herein designated VGAM RNA, also designated SEQ ID:4418.

[57498] Another function of VGAM1707 is therefore inhibition of LOC158722 (Accession XM\_088653). Accordingly, utilities of VGAM1707 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC158722. LOC162083 (Accession XM\_091339) is another VGAM1707 host target gene. LOC162083 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC162083, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC162083 BINDING SITE, designated SEQ ID:40048, to the nucleotide sequence of VGAM1707 RNA, herein designated VGAM RNA, also designated SEQ ID:4418.

[57499] Another function of VGAM1707 is therefore inhibition of LOC162083 (Accession XM\_091339). Accordingly, utilities of VGAM1707 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC162083. LOC201911 (Accession XM\_117339) is another VGAM1707 host target gene. LOC201911 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC201911, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201911 BINDING SITE, designated SEQ ID:43390, to

the nucleotide sequence of VGAM1707 RNA, herein designated VGAM RNA, also designated SEQ ID:4418.

[57500] Another function of VGAM1707 is therefore inhibition of LOC201911 (Accession XM\_117339). Accordingly, utilities of VGAM1707 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201911. LOC219653 (Accession XM\_166093) is another VGAM1707 host target gene. LOC219653 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219653, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219653 BINDING SITE, designated SEQ ID:43867, to the nucleotide sequence of VGAM1707 RNA, herein designated VGAM RNA, also designated SEQ ID:4418.

[57501] Another function of VGAM1707 is therefore inhibition of LOC219653 (Accession XM\_166093). Accordingly, utilities of VGAM1707 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219653. LOC221399 (Accession XM\_168134) is another VGAM1707 host target gene. LOC221399 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC221399, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221399 BINDING SITE, designated SEQ ID:45048, to the nucleotide sequence of VGAM1707 RNA, herein designated VGAM RNA, also designated SEQ ID:4418.

[57502] Another function of VGAM1707 is therefore inhibition of LOC221399 (Accession XM\_168134). Accordingly, utilities of VGAM1707 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221399. LOC90271 (Accession XM\_030445) is another VGAM1707 host target gene. LOC90271 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90271, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90271 BINDING SITE, designated SEQ ID:31045, to the nucleotide sequence of VGAM1707 RNA, herein designated VGAM RNA, also designated SEQ ID:4418.

[57503] Another function of VGAM1707 is therefore inhibition of LOC90271 (Accession XM\_030445). Accordingly, utilities

of VGAM1707 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90271. LOC90550 (Accession XM\_054582) is another VGAM1707 host target gene. LOC90550 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90550, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90550 BINDING SITE, designated SEQ ID:36177, to the nucleotide sequence of VGAM1707 RNA, herein designated VGAM RNA, also designated SEQ ID:4418.

[57504] Another function of VGAM1707 is therefore inhibition of LOC90550 (Accession XM\_054582). Accordingly, utilities of VGAM1707 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90550. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1708 (VGAM1708) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[57505] VGAM1708 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1708 was detected is described hereinabove with reference to Figs. 1-8.

[57506] VGAM1708 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Adenovirus B. VGAM1708 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[57507] VGAM1708 gene encodes a VGAM1708 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1708 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1708 precursor RNA is designated SEQ ID:1694, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1694 is located at position 17661 relative to the genome of Bovine Adenovirus B.

[57508] VGAM1708 precursor RNA folds onto itself, forming VGAM1708 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[57509] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1708 folded precursor RNA into VGAM1708 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM1708 RNA is designated SEQ ID:4419, and is provided hereinbelow with reference to the sequence listing part.

[57510] VGAM1708 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1708 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1708 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[57511] VGAM1708 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1708 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1708 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1708 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1708 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[57512] The complementary binding of VGAM1708 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1708 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1708 host target RNA into VGAM1708 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[57513] It is appreciated that VGAM1708 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1708 host target genes. The mRNA of each one of this plurality of VGAM1708 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1708 RNA, herein designated VGAM RNA, and which when bound by VGAM1708 RNA causes inhibition of translation of respective one or more VGAM1708 host target proteins.

[57514] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1708 gene, herein designated VGAM GENE, on one or more VGAM1708 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[57515] It is yet further appreciated that a function of VGAM1708 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1708 include diagnosis, prevention and treatment of viral infection by Bovine Adenovirus B. Specific functions, and accordingly utilities, of VGAM1708 correlate with, and may be deduced from, the identity of the host target genes which VGAM1708 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[57516] Nucleotide sequences of the VGAM1708 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the  
`diced` VGAM1708 RNA, herein designated VGAM RNA,  
and a schematic representation of the secondary folding  
of VGAM1708 folded precursor RNA, herein designated  
VGAM FOLDED PRECURSOR RNA, of VGAM1708 are further  
described hereinbelow with reference to Table 1.

[57517] Nucleotide sequences of host target binding sites, such as  
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of  
Fig. 1, found on VGAM1708 host target RNA, and  
schematic representation of the complementarity of each  
of these host target binding sites to VGAM1708 RNA,  
herein designated VGAM RNA, are described hereinbelow  
with reference to Table 2.

[57518] As mentioned hereinabove with reference to Fig. 1, a  
function of VGAM1708 gene, herein designated VGAM is  
inhibition of expression of VGAM1708 target genes. It is  
appreciated that specific functions, and accordingly utili-  
ties, of VGAM1708 correlate with, and may be deduced  
from, the identity of the target genes which VGAM1708  
binds and inhibits, and the function of these target genes,  
as elaborated hereinbelow.

[57519] A Disintegrin-like and Metalloprotease (reprolysin type)  
with Thrombospondin Type 1 Motif, 3 (ADAMTS3, Acces-

sion NM\_014243) is a VGAM1708 host target gene.

ADAMTS3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADAMTS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAMTS3 BINDING SITE, designated SEQ ID:15511, to the nucleotide sequence of VGAM1708 RNA, herein designated VGAM RNA, also designated SEQ ID:4419.

[57520] A function of VGAM1708 is therefore inhibition of A Disintegrin-like and Metalloprotease (reprolysin type) with Thrombospondin Type 1 Motif, 3 (ADAMTS3, Accession NM\_014243), a gene which cleaves the propeptides of type ii collagen prior to fibril assembly. Accordingly, utilities of VGAM1708 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAMTS3. The function of ADAMTS3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM211. Apoptotic Protease Activating Factor (APAF1, Accession NM\_013229) is another VGAM1708 host target gene. APAF1 BINDING SITE1

and APAF1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by APAF1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APAF1 BINDING SITE1 and APAF1 BINDING SITE2, designated SEQ ID:14872 and SEQ ID:6833 respectively, to the nucleotide sequence of VGAM1708 RNA, herein designated VGAM RNA, also designated SEQ ID:4419.

[57521] Another function of VGAM1708 is therefore inhibition of Apoptotic Protease Activating Factor (APAF1, Accession NM\_013229), a gene which functions in the mitochondrial apoptotic pathway that leads to caspase 9 dependent activation of caspase 3. Accordingly, utilities of VGAM1708 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APAF1. The function of APAF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM552.Cerebellar Degeneration-related Protein 2, 62kDa (CDR2, Accession XM\_071866) is another VGAM1708 host target gene. CDR2 BINDING SITE is HOST

TARGET binding site found in the 5` untranslated region of mRNA encoded by CDR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDR2 BINDING SITE, designated SEQ ID:37429, to the nucleotide sequence of VGAM1708 RNA, herein designated VGAM RNA, also designated SEQ ID:4419.

[57522] Another function of VGAM1708 is therefore inhibition of Cerebellar Degeneration-related Protein 2, 62kDa (CDR2, Accession XM\_071866), a gene which plays a role in cytokinesis, cell shape, and functions such as secretion and capping. Accordingly, utilities of VGAM1708 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDR2. The function of CDR2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM128. Dihydropyrimidinase-like 2 (DPYSL2, Accession NM\_001386) is another VGAM1708 host target gene. DPYSL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DPYSL2, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DPYSL2 BINDING SITE, designated SEQ ID:7067, to the nucleotide sequence of VGAM1708 RNA, herein designated VGAM RNA, also designated SEQ ID:4419.

[57523] Another function of VGAM1708 is therefore inhibition of Dihydropyrimidinase-like 2 (DPYSL2, Accession NM\_001386), a gene which is a member of the dihydropyrimidinase family. Accordingly, utilities of VGAM1708 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DPYSL2. The function of DPYSL2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM217. Phosducin-like (PDCL, Accession NM\_005388) is another VGAM1708 host target gene. PDCL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDCL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDCL BINDING SITE, designated SEQ ID:11867, to the nucleotide

sequence of VGAM1708 RNA, herein designated VGAM RNA, also designated SEQ ID:4419.

[57524] Another function of VGAM1708 is therefore inhibition of Phosducin-like (PDCL, Accession NM\_005388), a gene which may regulate G-protein signaling and similar to phosducins. Accordingly, utilities of VGAM1708 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDCL. The function of PDCL has been established by previous studies. Phosducin-like protein (PDCL) is a putative modulator of heterotrimeric G proteins. It was initially isolated as the product of an ethanol-responsive gene in neural cell cultures (Miles et al., 1993). PDCL shares extensive amino acid sequence homology with phosducin (PDC; 171490), a phosphoprotein expressed in retina and pineal gland that inhibits several G protein-coupled signaling pathways by binding to the beta-gamma subunits of G proteins. By screening a human genomic library with a rat Pdcl cDNA, Thibault et al. (1999) isolated a partial PDCL genomic sequence. They also identified several PDCL ESTs. The authors derived the complete PDCL coding sequence by aligning the genomic and EST sequences. The predicted 301-amino acid PDCL protein shows homology to areas of rat Pdc that contact G

protein beta-gamma subunits. The N-terminal regions of human, rat, and *Drosophila* PDCL are highly homologous to each other, but show little homology to the N-terminal region of rat Pdc. By somatic cell hybrid analysis, Thibault et al. (1999) mapped the PDCL gene to chromosome 9. Using a radiation hybrid mapping panel, they found that the PDCL gene is linked to markers D9S1876 and D9S1674.

[57525] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[57526] Miles, M. F.; Barhite, S.; Sganga, M.; Elliott, M. : Phosducin-like protein: an ethanol-responsive potential modulator of guanine nucleotide-binding protein function. Proc. Nat. Acad. Sci. 90: 10831-10835, 1993. ; and

[57527] Thibault, C.; Wang, J. F.; Charnas, R.; Mirel, D.; Barhite, S.; Miles, M. F. : Cloning and characterization of the rat and human phosducin-like protein genes: structure, expression and.

[57528] Further studies establishing the function and utilities of PDCL are found in John Hopkins OMIM database record ID 604421, and in cited publications numbered 7403-7404 listed in the bibliography section hereinbelow, which are

also hereby incorporated by reference. Requiem, Apoptosis Response Zinc Finger Gene (REQ, Accession NM\_006268) is another VGAM1708 host target gene. REQ BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by REQ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of REQ BINDING SITE, designated SEQ ID:12953, to the nucleotide sequence of VGAM1708 RNA, herein designated VGAM RNA, also designated SEQ ID:4419.

[57529] Another function of VGAM1708 is therefore inhibition of Requiem, Apoptosis Response Zinc Finger Gene (REQ, Accession NM\_006268), a gene which is a putative zinc finger that is required for apoptosis in murine myeloid cell lines. Accordingly, utilities of VGAM1708 include diagnosis, prevention and treatment of diseases and clinical conditions associated with REQ. The function of REQ and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1224. Splicing Factor Proline/glutamine Rich (polypyrimidine tract binding protein associated) (SFPQ, Accession NM\_005066) is another

VGAM1708 host target gene. SFPQ BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SFPQ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFPQ BINDING SITE, designated SEQ ID:11505, to the nucleotide sequence of VGAM1708 RNA, herein designated VGAM RNA, also designated SEQ ID:4419.

[57530] Another function of VGAM1708 is therefore inhibition of Splicing Factor Proline/glutamine Rich (polypyrimidine tract binding protein associated) (SFPQ, Accession NM\_005066), a gene which binds intronic polypyrimidine tracts. Accordingly, utilities of VGAM1708 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFPQ. The function of SFPQ has been established by previous studies. Patton et al. (1993) identified a 100-kD protein that copurified and associated with polypyrimidine tract-binding protein (PTB; 600693). By microsequence analysis and PCR, followed by screening a fetal brain cDNA library, Patton et al. (1993) isolated cDNAs encoding alternatively spliced isoforms of this protein, which they called PSF (PTB-associated splicing fac-

tor). The deduced 669- and 707-amino acid PSF isoforms contain 2 consensus RNA-binding domains and an unusual N terminus rich in proline and glutamine residues. PSF is highly basic and has a predicted molecular mass of 76 kD, which is much lower than the experimentally determined molecular mass of 100 kD. Northern blot analysis detected PSF transcripts of 2.5 and 3.0 kb, consistent with the alternative splicing. The authors found that the RNA-binding properties of PSF are identical to those of PTB and that both proteins, together and independently, bind the polypyrimidine tract of mammalian introns. Biochemical complementation, antibody inhibition, and immunodepletion experiments demonstrated that PSF is an essential pre-mRNA splicing factor required early in spliceosome formation. Bacterially synthesized PSF was able to complement immunodepleted extracts and restore splicing activity. Despite its association with PSF, complementary experiments with antibodies against PTB did not suggest an essential role for PTB in pre-mRNA splicing. Clark et al. (1997) identified cases of papillary renal cell carcinoma in which the splicing factor gene PSF was partnered with the TFE3 gene as a result of a translocation, t(X;1)(p11.2;p34).

[57531] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[57532] Patton, J. G.; Porro, E. B.; Galceran, J.; Tempst, P.; Nadal-Ginard, B. : Cloning and characterization of PSF, a novel pre-mRNA splicing factor. *Genes Dev.* 7: 393–406, 1993. ; and

[57533] Clark, J.; Lu, Y.-J.; Sidhar, S. K.; Parker, C.; Gill, S.; Smedley, D.; Hamoudi, R.; Linehan, W. M.; Shipley, J.; Cooper, C. S. : Fusion of splicing factor genes PSF and NonO (p54-nrb) to.

[57534] Further studies establishing the function and utilities of SFPQ are found in John Hopkins OMIM database record ID 605199, and in cited publications numbered 6610–6611 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Nuclear Antigen Sp100 (SP100, Accession NM\_003113) is another VGAM1708 host target gene. SP100 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SP100, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SP100 BINDING SITE,

designated SEQ ID:9086, to the nucleotide sequence of VGAM1708 RNA, herein designated VGAM RNA, also designated SEQ ID:4419.

[57535] Another function of VGAM1708 is therefore inhibition of Nuclear Antigen Sp100 (SP100, Accession NM\_003113), a gene which may be involved in transduction of interferon action. Accordingly, utilities of VGAM1708 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SP100. The function of SP100 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM520.Chromosome 17 Open Reading Frame 26 (C17orf26, Accession NM\_139177) is another VGAM1708 host target gene. C17orf26 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C17orf26, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C17orf26 BINDING SITE, designated SEQ ID:29190, to the nucleotide sequence of VGAM1708 RNA, herein designated VGAM RNA, also designated SEQ ID:4419.

[57536] Another function of VGAM1708 is therefore inhibition of Chromosome 17 Open Reading Frame 26 (C17orf26, Accession NM\_139177). Accordingly, utilities of VGAM1708 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C17orf26. Cyclin M1 (CNNM1, Accession NM\_020348) is another VGAM1708 host target gene. CNNM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CNNM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNNM1 BINDING SITE, designated SEQ ID:21614, to the nucleotide sequence of VGAM1708 RNA, herein designated VGAM RNA, also designated SEQ ID:4419.

[57537] Another function of VGAM1708 is therefore inhibition of Cyclin M1 (CNNM1, Accession NM\_020348). Accordingly, utilities of VGAM1708 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNNM1. DKFZp547O146 (Accession NM\_020224) is another VGAM1708 host target gene. DKFZp547O146 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DK-

FZp547O146, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547O146 BINDING SITE, designated SEQ ID:21487, to the nucleotide sequence of VGAM1708 RNA, herein designated VGAM RNA, also designated SEQ ID:4419.

[57538] Another function of VGAM1708 is therefore inhibition of DKFZp547O146 (Accession NM\_020224). Accordingly, utilities of VGAM1708 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547O146. DKFZP564J157 (Accession NM\_018457) is another VGAM1708 host target gene. DKFZP564J157 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564J157, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564J157 BINDING SITE, designated SEQ ID:20530, to the nucleotide sequence of VGAM1708 RNA, herein designated VGAM RNA, also designated SEQ ID:4419.

[57539] Another function of VGAM1708 is therefore inhibition of

DKFZP564J157 (Accession NM\_018457). Accordingly, utilities of VGAM1708 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564J157. DKFZp761K1423 (Accession NM\_018422) is another VGAM1708 host target gene. DKFZp761K1423 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZp761K1423, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761K1423 BINDING SITE, designated SEQ ID:20476, to the nucleotide sequence of VGAM1708 RNA, herein designated VGAM RNA, also designated SEQ ID:4419.

[57540] Another function of VGAM1708 is therefore inhibition of DKFZp761K1423 (Accession NM\_018422). Accordingly, utilities of VGAM1708 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761K1423. FLJ20511 (Accession NM\_017853) is another VGAM1708 host target gene. FLJ20511 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20511, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20511 BINDING SITE, designated SEQ ID:19531, to the nucleotide sequence of VGAM1708 RNA, herein designated VGAM RNA, also designated SEQ ID:4419.

[57541] Another function of VGAM1708 is therefore inhibition of FLJ20511 (Accession NM\_017853). Accordingly, utilities of VGAM1708 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20511. KIAA1130 (Accession XM\_031104) is another VGAM1708 host target gene. KIAA1130 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1130, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1130 BINDING SITE, designated SEQ ID:31290, to the nucleotide sequence of VGAM1708 RNA, herein designated VGAM RNA, also designated SEQ ID:4419.

[57542] Another function of VGAM1708 is therefore inhibition of KIAA1130 (Accession XM\_031104). Accordingly, utilities of VGAM1708 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1130. KIAA1238 (Accession XM\_048675) is another VGAM1708 host target gene. KIAA1238 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1238, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1238 BINDING SITE, designated SEQ ID:35219, to the nucleotide sequence of VGAM1708 RNA, herein designated VGAM RNA, also designated SEQ ID:4419.

[57543] Another function of VGAM1708 is therefore inhibition of KIAA1238 (Accession XM\_048675). Accordingly, utilities of VGAM1708 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1238. KIAA1466 (Accession XM\_050285) is another VGAM1708 host target gene. KIAA1466 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1466, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1466 BINDING SITE, designated SEQ ID:35604, to the nucleotide sequence of VGAM1708 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4419.

[57544] Another function of VGAM1708 is therefore inhibition of KIAA1466 (Accession XM\_050285). Accordingly, utilities of VGAM1708 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1466. KIAA1536 (Accession NM\_020898) is another VGAM1708 host target gene. KIAA1536 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1536, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1536 BINDING SITE, designated SEQ ID:21926, to the nucleotide sequence of VGAM1708 RNA, herein designated VGAM RNA, also designated SEQ ID:4419.

[57545] Another function of VGAM1708 is therefore inhibition of KIAA1536 (Accession NM\_020898). Accordingly, utilities of VGAM1708 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1536. KIAA1956 (Accession XM\_085836) is another VGAM1708 host target gene. KIAA1956 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1956, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1956 BINDING SITE, designated SEQ ID:38365, to the nucleotide sequence of VGAM1708 RNA, herein designated VGAM RNA, also designated SEQ ID:4419.

[57546] Another function of VGAM1708 is therefore inhibition of KIAA1956 (Accession XM\_085836). Accordingly, utilities of VGAM1708 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1956. KOC1 (Accession XM\_165847) is another VGAM1708 host target gene. KOC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KOC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KOC1 BINDING SITE, designated SEQ ID:43782, to the nucleotide sequence of VGAM1708 RNA, herein designated VGAM RNA, also designated SEQ ID:4419.

[57547] Another function of VGAM1708 is therefore inhibition of KOC1 (Accession XM\_165847). Accordingly, utilities of VGAM1708 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KOC1. MGC15619 (Accession NM\_032369) is another VGAM1708 host target gene. MGC15619 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC15619, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC15619 BINDING SITE, designated SEQ ID:26159, to the nucleotide sequence of VGAM1708 RNA, herein designated VGAM RNA, also designated SEQ ID:4419.

[57548] Another function of VGAM1708 is therefore inhibition of MGC15619 (Accession NM\_032369). Accordingly, utilities of VGAM1708 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15619. MGC16824 (Accession NM\_020314) is another VGAM1708 host target gene. MGC16824 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC16824, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC16824 BINDING SITE, designated SEQ ID:21573, to

the nucleotide sequence of VGAM1708 RNA, herein designated VGAM RNA, also designated SEQ ID:4419.

[57549] Another function of VGAM1708 is therefore inhibition of MGC16824 (Accession NM\_020314). Accordingly, utilities of VGAM1708 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC16824. NET-2 (Accession NM\_012338) is another VGAM1708 host target gene. NET-2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NET-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NET-2 BINDING SITE, designated SEQ ID:14734, to the nucleotide sequence of VGAM1708 RNA, herein designated VGAM RNA, also designated SEQ ID:4419.

[57550] Another function of VGAM1708 is therefore inhibition of NET-2 (Accession NM\_012338). Accordingly, utilities of VGAM1708 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NET-2. NY-REN-60 (Accession XM\_040506) is another VGAM1708 host target gene. NY-REN-60 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of

mRNA encoded by NY-REN-60, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NY-REN-60 BINDING SITE, designated SEQ ID:33320, to the nucleotide sequence of VGAM1708 RNA, herein designated VGAM RNA, also designated SEQ ID:4419.

[57551] Another function of VGAM1708 is therefore inhibition of NY-REN-60 (Accession XM\_040506). Accordingly, utilities of VGAM1708 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NY-REN-60. RENT2 (Accession NM\_015542) is another VGAM1708 host target gene. RENT2 BINDING SITE1 and RENT2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RENT2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RENT2 BINDING SITE1 and RENT2 BINDING SITE2, designated SEQ ID:17804 and SEQ ID:27910 respectively, to the nucleotide sequence of VGAM1708 RNA, herein designated VGAM RNA, also designated SEQ ID:4419.

[57552] Another function of VGAM1708 is therefore inhibition of RENT2 (Accession NM\_015542). Accordingly, utilities of VGAM1708 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RENT2. LOC146839 (Accession XM\_097107) is another VGAM1708 host target gene. LOC146839 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC146839, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146839 BINDING SITE, designated SEQ ID:40757, to the nucleotide sequence of VGAM1708 RNA, herein designated VGAM RNA, also designated SEQ ID:4419.

[57553] Another function of VGAM1708 is therefore inhibition of LOC153205 (Accession XM\_098322). Accordingly, utilities of VGAM1708 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153205. LOC153205 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC153205, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153205 BINDING SITE, designated SEQ ID:41583, to the nucleotide sequence of VGAM1708 RNA, herein designated VGAM RNA, also designated SEQ ID:4419.

[57554] Another function of VGAM1708 is therefore inhibition of LOC153205 (Accession XM\_098322). Accordingly, utilities of VGAM1708 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153205. LOC197125 (Accession XM\_113826) is another VGAM1708 host target gene. LOC197125 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC197125, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197125 BINDING SITE, designated SEQ ID:42450, to the nucleotide sequence of VGAM1708 RNA, herein designated VGAM RNA, also designated SEQ ID:4419.

[57555] Another function of VGAM1708 is therefore inhibition of LOC197125 (Accession XM\_113826). Accordingly, utilities of VGAM1708 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC197125. LOC56912 (Accession NM\_020153) is another VGAM1708 host target gene. LOC56912 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC56912, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC56912 BINDING SITE, designated SEQ ID:21366, to the nucleotide sequence of VGAM1708 RNA, herein designated VGAM RNA, also designated SEQ ID:4419.

[57556] Another function of VGAM1708 is therefore inhibition of LOC56912 (Accession NM\_020153). Accordingly, utilities of VGAM1708 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC56912. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1709 (VGAM1709) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[57557] VGAM1709 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1709 was detected is described hereinabove with reference to Figs. 1–8.

[57558] VGAM1709 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Semliki Forest Virus.

VGAM1709 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[57559] VGAM1709 gene encodes a VGAM1709 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1709 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1709 precursor RNA is designated SEQ ID:1695, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1695 is located at position 4455 relative to the genome of Semliki Forest Virus.

[57560] VGAM1709 precursor RNA folds onto itself, forming VGAM1709 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[57561] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1709 folded precursor RNA into VGAM1709 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1709 RNA is designated SEQ ID:4420, and is provided hereinbelow with reference to the sequence listing part.

[57562] VGAM1709 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1709 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1709 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[57563] VGAM1709 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1709 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1709 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1709 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1709 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[57564] The complementary binding of VGAM1709 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1709 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1709 host target RNA into VGAM1709 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[57565] It is appreciated that VGAM1709 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1709 host target genes. The mRNA of each one of this plurality of VGAM1709 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1709 RNA, herein designated VGAM RNA, and which when bound by VGAM1709 RNA causes inhibition of translation of respective one or more VGAM1709 host target proteins.

[57566] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1709 gene, herein designated VGAM GENE, on one or more VGAM1709 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[57567] It is yet further appreciated that a function of VGAM1709 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1709 include diagnosis, prevention and treatment of viral infection by Semliki Forest Virus. Specific functions, and accordingly utilities, of VGAM1709 correlate with, and may be deduced from, the identity of the host target genes which VGAM1709 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[57568] Nucleotide sequences of the VGAM1709 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1709 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM1709 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1709 are further described hereinbelow with reference to Table 1.

[57569] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1709 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1709 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[57570] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1709 gene, herein designated VGAM is inhibition of expression of VGAM1709 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1709 correlate with, and may be deduced from, the identity of the target genes which VGAM1709 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[57571] Centromere Protein F, 350/400ka (mitosin) (CENPF, Accession NM\_016343) is a VGAM1709 host target gene. CENPF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CENPF,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CENPF BINDING SITE, designated SEQ ID:18469, to the nucleotide sequence of VGAM1709 RNA, herein designated VGAM RNA, also designated SEQ ID:4420.

[57572] A function of VGAM1709 is therefore inhibition of Centromere Protein F, 350/400ka (mitosin) (CENPF, Accession NM\_016343), a gene which is a protein of the nuclear matrix and regulates mitosis. Accordingly, utilities of VGAM1709 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CENPF. The function of CENPF has been established by previous studies. Rattner et al. (1993) identified a human kinetochore protein with a molecular weight of approximately 400 kD. Designated centromeric protein F, it was only transiently associated with kinetochores from the onset of mitosis to metaphase. Liao et al. (1995) reported the cDNA sequence of CENPF, together with its expression and localization patterns at different stages of the HeLa cell cycle. CENPF is a protein of the nuclear matrix that gradually accumulates during the cell cycle until it reaches

peak levels in G2 and M phase cells and is rapidly degraded upon completion of mitosis. CENPF is first detected at the prekinetochore complex during late G2, and by prophase is clearly detectable as paired foci that correspond to all the centromeres. During mitosis, CENPF is associated with kinetochores from prometaphase until early anaphase and then is detected at the spindle midzone throughout the remainder of anaphase. By telophase, CENPF is concentrated within the intracellular bridge at either side of the midbody. The predicted structure of the 367-kD CENPF protein consists of two 1,600-amino acid-long coil domains that flank a central flexible core.

[57573] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[57574] Liao, H.; Winkfein, R. J.; Mack, G.; Rattner, J. B.; Yen, T. J. : CENP-F is a protein of the nuclear matrix that assembles onto kinetochores at late G2 and is rapidly degraded after mitosis. *J. Cell Biol.* 130: 507-518, 1995. ; and

[57575] Liao, H.; Winkfein, R. J.; Mack, G.; Rattner, J. B.; Yen, T. J. : CENP-F is a protein of the nuclear matrix that assembles onto kinetochores at late G2 and is rapidly degraded after mitosis.

[57576] Further studies establishing the function and utilities of CENPF are found in John Hopkins OMIM database record ID 600236, and in cited publications numbered 7865–786 and 7676 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. C-type (calcium dependent, carbohydrate–recognition domain) Lectin, Superfamily Member 5 (CLECSF5, Accession NM\_013252) is another VGAM1709 host target gene. CLECSF5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CLECSF5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLECSF5 BINDING SITE, designated SEQ ID:14920, to the nucleotide sequence of VGAM1709 RNA, herein designated VGAM RNA, also designated SEQ ID:4420.

[57577] Another function of VGAM1709 is therefore inhibition of C-type (calcium dependent, carbohydrate–recognition domain) Lectin, Superfamily Member 5 (CLECSF5, Accession NM\_013252). Accordingly, utilities of VGAM1709 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLECSF5. Carboxypeptidase

D (CPD, Accession NM\_001304) is another VGAM1709 host target gene. CPD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CPD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CPD BINDING SITE, designated SEQ ID:6982, to the nucleotide sequence of VGAM1709 RNA, herein designated VGAM RNA, also designated SEQ ID:4420.

[57578] Another function of VGAM1709 is therefore inhibition of Carboxypeptidase D (CPD, Accession NM\_001304), a gene which is a membrane-bound metalloprotease. Accordingly, utilities of VGAM1709 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPD. The function of CPD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM596. Erythrocyte Membrane Protein Band 4.1 (elliptocytosis 1, RH-linked) (EPB41, Accession NM\_004437) is another VGAM1709 host target gene. EPB41 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EPB41,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPB41 BINDING SITE, designated SEQ ID:10722, to the nucleotide sequence of VGAM1709 RNA, herein designated VGAM RNA, also designated SEQ ID:4420.

[57579] Another function of VGAM1709 is therefore inhibition of Erythrocyte Membrane Protein Band 4.1 (elliptocytosis 1, RH-linked) (EPB41, Accession NM\_004437), a gene which protein 4.1 is a major structural element of the erythrocyte membrane skeleton. it plays a key role in regulating membrane physical properties of mechanical stability and deformability by stabilizing spectrin-actin interaction. binds with a high affinity to glycophorin and with lower affinity to band iii protein. associates with the nuclear mitotic apparatus. Accordingly, utilities of VGAM1709 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPB41. The function of EPB41 has been established by previous studies. Conboy et al. (1986) reported the molecular cloning and characterization of human erythrocyte protein 4.1 cDNA and the complete amino acid sequence of the protein derived from

the nucleotide sequence. Probes prepared from the cloned erythrocyte protein 4.1 cDNA hybridized with distinct mRNA species from a wide variety of nonerythroid tissues including brain, liver, placenta, pancreas, and intestine, implying substantial homology between erythroid and nonerythroid protein 4.1. Brain protein 4.1, also known as synapsin I (OMIM Ref. No. 313440), is the best characterized of the nonerythroid forms. It is of note that brain protein 4.1 is coded by the X chromosome, whereas erythrocyte protein 4.1 is coded by chromosome 1. Conboy et al. (1986) showed by Southern blot analysis of genomic DNA from an Algerian family that in affected members the mutant protein 4.1 gene had a DNA rearrangement upstream from the initiation codon for translation. The mRNA from the mutant gene was aberrantly spliced. They assigned the gene to 1pter-p32 by hybridization of the cDNA to a panel of chromosomes separated by fluorescence-activated cell sorter. It does not necessarily follow that all Rh-linked elliptocytosis must have hemolytic anemia. The mutation can reside in the protein 4.1 gene but be of a different type which does not lead to severe hemolytic anemia. Indeed, it is known that most Rh-linked elliptocytosis is nonhemolytic. Partial deletion was found

in 1 family with elliptocytosis (Kan, 1986). Lambert et al. (1988) found an elliptocytosis family in which an apparent rearrangement of the coding region of the protein 4.1 gene led to restriction fragment length polymorphism when DNA was tested using a fragment of the cDNA that encompassed the coding region of the gene. Contrariwise, the basic defect in at least 1 form of non-Rh-linked elliptocytosis was known, namely the defect in alpha-spectrin which maps to 1q. Tang et al. (1988) compared nucleotide sequences of mRNA encoding erythroid and lymphoid protein 4.1 isoforms. The lymphoid protein 4.1 isoforms exhibited several nucleotide sequence motifs that appeared either to be inserted into or deleted from the mRNA by alternative splicing of a common mRNA precursor. One of the motifs, located within the spectrin-actin binding domain, was found only in erythroid cells and was specifically produced during erythroid cell maturation. Conboy et al. (1988) demonstrated that alternative splicing accounts for multiple isoforms of protein 4.1 in red cells. In his Figure 2, Conboy (1993) provided a map of the alternative splicing of protein 4.1 mRNA, emphasizing the total chromosome relative to many combinatorial splicing possibilities among the exons of the EPB41 gene.

There are, furthermore, 2 AUG initiation codons, 1 of which accounts for an N-terminal extension on the 80-kD gene product. By tissue screening, Baklouti et al. (1997) examined the complex pattern of alternative splicing variants of the protein 4.1 gene. They noted that many splicing variations occur in the spectrin/actin binding (SAB) domain. In particular, they found a 51-bp exon that was expressed almost exclusively in muscle. Genomic cloning revealed a total of 22 exons spanning approximately 200 kb containing the entire erythroid and nonerythroid coding sequence of the human locus. Animal model experiments lend further support to the function of EPB41. The complex EPB41 gene on human 1p encodes a diverse family of protein 4.1R isoforms. The prototypical 80-kD 4.1R in mature erythrocytes is a key component of the erythroid membrane skeleton that regulates red cell morphology and mechanical stability. To study the function of 4.1R in nucleated cells, Shi et al. (1999) generated mice with complete deficiency of all 4.1R protein isoforms. These 4.1R-null mice were viable, with moderate hemolytic anemia but no gross abnormalities. Platelet morphology and function were essentially normal. Non-erythroid 4.1R expression patterns revealed focal expres-

sion in specific neurons in the brain and in select cells of other major organs, challenging the view that 4.1R expression is widespread among nonerythroid cells.

[57580] It is appreciated that the abovementioned animal model for EPB41 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[57581] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[57582] Shi, Z.-T.; Afzal, V.; Collier, B.; Patel, D.; Chasis, J. A.; Parra, M.; Lee, G.; Paszty, C.; Stevens, M.; Walensky, L.; Peters, L. L.; Mohandas, N.; Rubin, E.; Conboy, J. G. : Protein 4.1R-deficient mice are viable but have erythroid membrane skeleton abnormalities. J. Clin. Invest. 103: 331-340, 1999. ; and

[57583] Baklouti, F.; Huang, S.-C.; Vulliamy, T. J.; Delaunay, J.; Benz, E. J., Jr. : Organization of the human protein 4.1 genomic locus: new insights into the tissue-specific alternative splicing.

[57584] Further studies establishing the function and utilities of EPB41 are found in John Hopkins OMIM database record ID 130500, and in cited publications numbered 2570-2585,

2671, 12764–1276 and 12489–12514 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FUS1 (Accession NM\_007275) is another VGAM1709 host target gene. FUS1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FUS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FUS1 BINDING SITE, designated SEQ ID:14135, to the nucleotide sequence of VGAM1709 RNA, herein designated VGAM RNA, also designated SEQ ID:4420.

[57585] Another function of VGAM1709 is therefore inhibition of FUS1 (Accession NM\_007275), a gene which may function as a tumor suppressor. Accordingly, utilities of VGAM1709 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FUS1. The function of FUS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1246. IRTA1 (Accession NM\_031282) is another VGAM1709 host target gene. IRTA1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region

of mRNA encoded by IRTA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IRTA1 BINDING SITE, designated SEQ ID:25301, to the nucleotide sequence of VGAM1709 RNA, herein designated VGAM RNA, also designated SEQ ID:4420.

[57586] Another function of VGAM1709 is therefore inhibition of IRTA1 (Accession NM\_031282). Accordingly, utilities of VGAM1709 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IRTA1. Macrophage Scavenger Receptor 1 (MSR1, Accession NM\_002445) is another VGAM1709 host target gene. MSR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MSR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MSR1 BINDING SITE, designated SEQ ID:8285, to the nucleotide sequence of VGAM1709 RNA, herein designated VGAM RNA, also designated SEQ ID:4420.

[57587] Another function of VGAM1709 is therefore inhibition of Macrophage Scavenger Receptor 1 (MSR1, Accession

NM\_002445), a gene which plays a role in endocytosis of macromolecules. Accordingly, utilities of VGAM1709 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MSR1. The function of MSR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM176. Tolloid-like 1 (TLL1, Accession NM\_012464) is another VGAM1709 host target gene. TLL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TLL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TLL1 BINDING SITE, designated SEQ ID:14837, to the nucleotide sequence of VGAM1709 RNA, herein designated VGAM RNA, also designated SEQ ID:4420.

[57588] Another function of VGAM1709 is therefore inhibition of Tolloid-like 1 (TLL1, Accession NM\_012464), a gene which is involved in bone morphogenesis. Accordingly, utilities of VGAM1709 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TLL1. The function of TLL1 and its association with

various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1583.TOX (Accession NM\_014729) is another VGAM1709 host target gene. TOX BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TOX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TOX BINDING SITE, designated SEQ ID:16324, to the nucleotide sequence of VGAM1709 RNA, herein designated VGAM RNA, also designated SEQ ID:4420.

[57589] Another function of VGAM1709 is therefore inhibition of TOX (Accession NM\_014729). Accordingly, utilities of VGAM1709 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOX. TRIM (Accession NM\_016388) is another VGAM1709 host target gene. TRIM BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TRIM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM BINDING SITE, designated SEQ

ID:18531, to the nucleotide sequence of VGAM1709 RNA, herein designated VGAM RNA, also designated SEQ ID:4420.

[57590] Another function of VGAM1709 is therefore inhibition of TRIM (Accession NM\_016388), a gene which plays a role in recruiting signaling proteins to the plasma membrane upon T-cell receptor (TCR) complex activation in T cells. Accordingly, utilities of VGAM1709 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM. The function of TRIM and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM227. Tripartite Motif-containing 9 (TRIM9, Accession NM\_015163) is another VGAM1709 host target gene. TRIM9 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TRIM9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM9 BINDING SITE, designated SEQ ID:17516, to the nucleotide sequence of VGAM1709 RNA, herein designated VGAM RNA, also designated SEQ ID:4420.

[57591] Another function of VGAM1709 is therefore inhibition of Tripartite Motif-containing 9 (TRIM9, Accession NM\_015163), a gene which may function as a positive regulator for mannosylphosphate transferase and is required to mediate mannosylphosphate transfer in both the core and outer chain portions of n-linked oligosaccharides. Accordingly, utilities of VGAM1709 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM9. The function of TRIM9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74.AAK1 (Accession NM\_014911) is another VGAM1709 host target gene. AAK1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by AAK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AAK1 BINDING SITE, designated SEQ ID:17142, to the nucleotide sequence of VGAM1709 RNA, herein designated VGAM RNA, also designated SEQ ID:4420.

[57592] Another function of VGAM1709 is therefore inhibition of AAK1 (Accession NM\_014911). Accordingly, utilities of

VGAM1709 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AAK1. Acetyl-Coenzyme A Acyltransferase 2 (mitochondrial 3-oxoacyl-Coenzyme A thiolase) (ACAA2, Accession XM\_166287) is another VGAM1709 host target gene. ACAA2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ACAA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACAA2 BINDING SITE, designated SEQ ID:44094, to the nucleotide sequence of VGAM1709 RNA, herein designated VGAM RNA, also designated SEQ ID:4420.

[57593] Another function of VGAM1709 is therefore inhibition of Acetyl-Coenzyme A Acyltransferase 2 (mitochondrial 3-oxoacyl-Coenzyme A thiolase) (ACAA2, Accession XM\_166287). Accordingly, utilities of VGAM1709 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACAA2. DKFZP564D166 (Accession NM\_030658) is another VGAM1709 host target gene. DKFZP564D166 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA

encoded by DKFZP564D166, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564D166 BINDING SITE, designated SEQ ID:24989, to the nucleotide sequence of VGAM1709 RNA, herein designated VGAM RNA, also designated SEQ ID:4420.

[57594] Another function of VGAM1709 is therefore inhibition of DKFZP564D166 (Accession NM\_030658). Accordingly, utilities of VGAM1709 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564D166. DKFZP564J102 (Accession XM\_038475) is another VGAM1709 host target gene. DKFZP564J102 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZP564J102, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564J102 BINDING SITE, designated SEQ ID:32848, to the nucleotide sequence of VGAM1709 RNA, herein designated VGAM RNA, also designated SEQ ID:4420.

[57595] Another function of VGAM1709 is therefore inhibition of

DKFZP564J102 (Accession XM\_038475). Accordingly, utilities of VGAM1709 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564J102. FLJ12488 (Accession NM\_031218) is another VGAM1709 host target gene. FLJ12488 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12488, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12488 BINDING SITE, designated SEQ ID:25263, to the nucleotide sequence of VGAM1709 RNA, herein designated VGAM RNA, also designated SEQ ID:4420.

[57596] Another function of VGAM1709 is therefore inhibition of FLJ12488 (Accession NM\_031218). Accordingly, utilities of VGAM1709 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12488. FLJ13593 (Accession NM\_024780) is another VGAM1709 host target gene. FLJ13593 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13593, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of FLJ13593 BINDING SITE, designated SEQ ID:24150, to the nucleotide sequence of VGAM1709 RNA, herein designated VGAM RNA, also designated SEQ ID:4420.

[57597] Another function of VGAM1709 is therefore inhibition of FLJ13593 (Accession NM\_024780). Accordingly, utilities of VGAM1709 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13593. FLJ20718 (Accession NM\_017939) is another VGAM1709 host target gene. FLJ20718 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20718, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20718 BINDING SITE, designated SEQ ID:19633, to the nucleotide sequence of VGAM1709 RNA, herein designated VGAM RNA, also designated SEQ ID:4420.

[57598] Another function of VGAM1709 is therefore inhibition of FLJ20718 (Accession NM\_017939). Accordingly, utilities of VGAM1709 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20718. FLJ23511 (Accession NM\_032239) is another

VGAM1709 host target gene. FLJ23511 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ23511, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23511 BINDING SITE, designated SEQ ID:25961, to the nucleotide sequence of VGAM1709 RNA, herein designated VGAM RNA, also designated SEQ ID:4420.

[57599] Another function of VGAM1709 is therefore inhibition of FLJ23511 (Accession NM\_032239). Accordingly, utilities of VGAM1709 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23511. KIAA0296 (Accession NM\_014699) is another VGAM1709 host target gene. KIAA0296 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0296, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0296 BINDING SITE, designated SEQ ID:16221, to the nucleotide sequence of VGAM1709 RNA, herein designated VGAM RNA, also designated SEQ ID:4420.

[57600] Another function of VGAM1709 is therefore inhibition of KIAA0296 (Accession NM\_014699). Accordingly, utilities of VGAM1709 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0296. KIAA0869 (Accession XM\_047992) is another VGAM1709 host target gene. KIAA0869 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0869, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0869 BINDING SITE, designated SEQ ID:35093, to the nucleotide sequence of VGAM1709 RNA, herein designated VGAM RNA, also designated SEQ ID:4420.

[57601] Another function of VGAM1709 is therefore inhibition of KIAA0869 (Accession XM\_047992). Accordingly, utilities of VGAM1709 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0869. KIAA1054 (Accession XM\_043493) is another VGAM1709 host target gene. KIAA1054 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1054, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1054 BINDING SITE, designated SEQ ID:33955, to the nucleotide sequence of VGAM1709 RNA, herein designated VGAM RNA, also designated SEQ ID:4420.

[57602] Another function of VGAM1709 is therefore inhibition of KIAA1054 (Accession XM\_043493). Accordingly, utilities of VGAM1709 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1054. MGC22014 (Accession XM\_035307) is another VGAM1709 host target gene. MGC22014 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC22014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC22014 BINDING SITE, designated SEQ ID:32219, to the nucleotide sequence of VGAM1709 RNA, herein designated VGAM RNA, also designated SEQ ID:4420.

[57603] Another function of VGAM1709 is therefore inhibition of MGC22014 (Accession XM\_035307). Accordingly, utilities of VGAM1709 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

MGC22014. MGC32104 (Accession NM\_144684) is another VGAM1709 host target gene. MGC32104 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC32104, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC32104 BINDING SITE, designated SEQ ID:29506, to the nucleotide sequence of VGAM1709 RNA, herein designated VGAM RNA, also designated SEQ ID:4420.

[57604] Another function of VGAM1709 is therefore inhibition of MGC32104 (Accession NM\_144684). Accordingly, utilities of VGAM1709 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC32104. MGC4832 (Accession NM\_145061) is another VGAM1709 host target gene. MGC4832 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC4832, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4832 BINDING SITE, designated SEQ ID:29700, to the nucleotide sequence of VGAM1709 RNA, herein designated VGAM

RNA, also designated SEQ ID:4420.

[57605] Another function of VGAM1709 is therefore inhibition of MGC4832 (Accession NM\_145061). Accordingly, utilities of VGAM1709 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4832. MST4 (Accession NM\_016542) is another VGAM1709 host target gene. MST4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MST4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MST4 BINDING SITE, designated SEQ ID:18608, to the nucleotide sequence of VGAM1709 RNA, herein designated VGAM RNA, also designated SEQ ID:4420.

[57606] Another function of VGAM1709 is therefore inhibition of MST4 (Accession NM\_016542). Accordingly, utilities of VGAM1709 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MST4. Pellino Homolog 2 (Drosophila) (PELI2, Accession NM\_021255) is another VGAM1709 host target gene. PELI2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PELI2,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PELI2 BINDING SITE, designated SEQ ID:22226, to the nucleotide sequence of VGAM1709 RNA, herein designated VGAM RNA, also designated SEQ ID:4420.

[57607] Another function of VGAM1709 is therefore inhibition of Pellino Homolog 2 (Drosophila) (PELI2, Accession NM\_021255). Accordingly, utilities of VGAM1709 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PELI2. Ras Association (RalGDS/AF-6) Domain Family 2 (RASSF2, Accession NM\_014737) is another VGAM1709 host target gene. RASSF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RASSF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RASSF2 BINDING SITE, designated SEQ ID:16393, to the nucleotide sequence of VGAM1709 RNA, herein designated VGAM RNA, also designated SEQ ID:4420.

[57608] Another function of VGAM1709 is therefore inhibition of

Ras Association (RalGDS/AF-6) Domain Family 2 (RASSF2, Accession NM\_014737). Accordingly, utilities of VGAM1709 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASSF2. LOC120939 (Accession XM\_073688) is another VGAM1709 host target gene. LOC120939 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC120939, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC120939 BINDING SITE, designated SEQ ID:37509, to the nucleotide sequence of VGAM1709 RNA, herein designated VGAM RNA, also designated SEQ ID:4420.

[57609] Another function of VGAM1709 is therefore inhibition of LOC120939 (Accession XM\_073688). Accordingly, utilities of VGAM1709 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120939. LOC145978 (Accession XM\_085288) is another VGAM1709 host target gene. LOC145978 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145978, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145978 BINDING SITE, designated SEQ ID:38032, to the nucleotide sequence of VGAM1709 RNA, herein designated VGAM RNA, also designated SEQ ID:4420.

[57610] Another function of VGAM1709 is therefore inhibition of LOC145978 (Accession XM\_085288). Accordingly, utilities of VGAM1709 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145978. LOC147077 (Accession XM\_085699) is another VGAM1709 host target gene. LOC147077 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147077, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147077 BINDING SITE, designated SEQ ID:38290, to the nucleotide sequence of VGAM1709 RNA, herein designated VGAM RNA, also designated SEQ ID:4420.

[57611] Another function of VGAM1709 is therefore inhibition of LOC147077 (Accession XM\_085699). Accordingly, utilities of VGAM1709 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC147077. LOC154930 (Accession XM\_088080) is another VGAM1709 host target gene. LOC154930 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154930, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154930 BINDING SITE, designated SEQ ID:39502, to the nucleotide sequence of VGAM1709 RNA, herein designated VGAM RNA, also designated SEQ ID:4420.

[57612] Another function of VGAM1709 is therefore inhibition of LOC154930 (Accession XM\_088080). Accordingly, utilities of VGAM1709 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154930. LOC169270 (Accession XM\_095607) is another VGAM1709 host target gene. LOC169270 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC169270, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC169270 BINDING SITE, designated SEQ ID:40275, to the nucleotide sequence of VGAM1709 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4420.

[57613] Another function of VGAM1709 is therefore inhibition of LOC169270 (Accession XM\_095607). Accordingly, utilities of VGAM1709 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC169270. LOC197358 (Accession XM\_113872) is another VGAM1709 host target gene. LOC197358 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC197358, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197358 BINDING SITE, designated SEQ ID:42508, to the nucleotide sequence of VGAM1709 RNA, herein designated VGAM RNA, also designated SEQ ID:4420.

[57614] Another function of VGAM1709 is therefore inhibition of LOC197358 (Accession XM\_113872). Accordingly, utilities of VGAM1709 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197358. LOC199775 (Accession XM\_114016) is another VGAM1709 host target gene. LOC199775 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199775, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199775 BINDING SITE, designated SEQ ID:42615, to the nucleotide sequence of VGAM1709 RNA, herein designated VGAM RNA, also designated SEQ ID:4420.

[57615] Another function of VGAM1709 is therefore inhibition of LOC199775 (Accession XM\_114016). Accordingly, utilities of VGAM1709 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199775. LOC199863 (Accession XM\_117147) is another VGAM1709 host target gene. LOC199863 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC199863, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199863 BINDING SITE, designated SEQ ID:43255, to the nucleotide sequence of VGAM1709 RNA, herein designated VGAM RNA, also designated SEQ ID:4420.

[57616] Another function of VGAM1709 is therefore inhibition of LOC199863 (Accession XM\_117147). Accordingly, utilities of VGAM1709 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC199863. LOC219672 (Accession XM\_166111) is another VGAM1709 host target gene. LOC219672 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC219672, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219672 BINDING SITE, designated SEQ ID:43889, to the nucleotide sequence of VGAM1709 RNA, herein designated VGAM RNA, also designated SEQ ID:4420.

[57617] Another function of VGAM1709 is therefore inhibition of LOC219672 (Accession XM\_166111). Accordingly, utilities of VGAM1709 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219672. LOC219894 (Accession XM\_167782) is another VGAM1709 host target gene. LOC219894 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC219894, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219894 BINDING SITE, designated SEQ ID:44796, to

the nucleotide sequence of VGAM1709 RNA, herein designated VGAM RNA, also designated SEQ ID:4420.

[57618] Another function of VGAM1709 is therefore inhibition of LOC219894 (Accession XM\_167782). Accordingly, utilities of VGAM1709 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219894. LOC220706 (Accession XM\_166001) is another VGAM1709 host target gene. LOC220706 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220706, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220706 BINDING SITE, designated SEQ ID:43837, to the nucleotide sequence of VGAM1709 RNA, herein designated VGAM RNA, also designated SEQ ID:4420.

[57619] Another function of VGAM1709 is therefore inhibition of LOC220706 (Accession XM\_166001). Accordingly, utilities of VGAM1709 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220706. LOC221103 (Accession XM\_167758) is another VGAM1709 host target gene. LOC221103 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC221103, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221103 BINDING SITE, designated SEQ ID:44779, to the nucleotide sequence of VGAM1709 RNA, herein designated VGAM RNA, also designated SEQ ID:4420.

[57620] Another function of VGAM1709 is therefore inhibition of LOC221103 (Accession XM\_167758). Accordingly, utilities of VGAM1709 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221103. LOC222681 (Accession XM\_167116) is another VGAM1709 host target gene. LOC222681 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222681, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222681 BINDING SITE, designated SEQ ID:44616, to the nucleotide sequence of VGAM1709 RNA, herein designated VGAM RNA, also designated SEQ ID:4420.

[57621] Another function of VGAM1709 is therefore inhibition of LOC222681 (Accession XM\_167116). Accordingly, utilities

of VGAM1709 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222681. LOC257507 (Accession XM\_175204) is another VGAM1709 host target gene. LOC257507 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC257507, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257507 BINDING SITE, designated SEQ ID:46682, to the nucleotide sequence of VGAM1709 RNA, herein designated VGAM RNA, also designated SEQ ID:4420.

[57622] Another function of VGAM1709 is therefore inhibition of LOC257507 (Accession XM\_175204). Accordingly, utilities of VGAM1709 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257507. LOC257625 (Accession XM\_175267) is another VGAM1709 host target gene. LOC257625 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC257625, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC257625 BINDING SITE, designated SEQ ID:46738, to the nucleotide sequence of VGAM1709 RNA, herein designated VGAM RNA, also designated SEQ ID:4420.

[57623] Another function of VGAM1709 is therefore inhibition of LOC257625 (Accession XM\_175267). Accordingly, utilities of VGAM1709 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257625. LOC90019 (Accession NM\_138567) is another VGAM1709 host target gene. LOC90019 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90019, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90019 BINDING SITE, designated SEQ ID:28872, to the nucleotide sequence of VGAM1709 RNA, herein designated VGAM RNA, also designated SEQ ID:4420.

[57624] Another function of VGAM1709 is therefore inhibition of LOC90019 (Accession NM\_138567). Accordingly, utilities of VGAM1709 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90019. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 1710 (VGAM1710) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[57625] VGAM1710 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1710 was detected is described hereinabove with reference to Figs. 1–8.

[57626] VGAM1710 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Semliki Forest Virus. VGAM1710 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[57627] VGAM1710 gene encodes a VGAM1710 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1710 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1710 precursor RNA is designated SEQ ID:1696, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1696 is located at position 7249 relative to the

genome of Semliki Forest Virus.

[57628] VGAM1710 precursor RNA folds onto itself, forming VGAM1710 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[57629] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1710 folded precursor RNA into VGAM1710 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1710 RNA is designated SEQ ID:4421, and is provided hereinbelow with reference to the sequence listing part.

[57630] VGAM1710 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1710 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1710 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[57631] VGAM1710 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1710 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1710 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1710 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1710 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[57632] The complementary binding of VGAM1710 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1710 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1710 host target RNA into VGAM1710 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[57633] It is appreciated that VGAM1710 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1710 host target genes. The mRNA of each one of this plurality of VGAM1710 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1710 RNA, herein designated VGAM RNA, and which when bound by VGAM1710 RNA causes inhibition of translation of respective one or more VGAM1710 host target proteins.

[57634] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1710 gene, herein designated VGAM GENE, on one or more VGAM1710 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[57635] It is yet further appreciated that a function of VGAM1710 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1710 include diagnosis, prevention and treatment of viral infection by Semliki Forest Virus. Specific functions, and accordingly utilities, of VGAM1710

correlate with, and may be deduced from, the identity of the host target genes which VGAM1710 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[57636] Nucleotide sequences of the VGAM1710 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1710 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1710 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1710 are further described hereinbelow with reference to Table 1.

[57637] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1710 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1710 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[57638] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1710 gene, herein designated VGAM is inhibition of expression of VGAM1710 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1710 correlate with, and may be deduced

from, the identity of the target genes which VGAM1710 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[57639] Cytokine Inducible SH2-containing Protein (CISH, Accession NM\_013324) is a VGAM1710 host target gene. CISH BINDING SITE1 and CISH BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CISH, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CISH BINDING SITE1 and CISH BINDING SITE2, designated SEQ ID:14973 and SEQ ID:29706 respectively, to the nucleotide sequence of VGAM1710 RNA, herein designated VGAM RNA, also designated SEQ ID:4421.

[57640] A function of VGAM1710 is therefore inhibition of Cytokine Inducible SH2-containing Protein (CISH, Accession NM\_013324), a gene which intervenes in the negative regulation of cytokines. Accordingly, utilities of VGAM1710 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CISH. The function of CISH and its association with various diseases and clinical conditions, has been established by previous studies,

as described hereinabove with reference to VGAM488.Chromosome 20 Open Reading Frame 162 (C20orf162, Accession NM\_080603) is another VGAM1710 host target gene. C20orf162 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by C20orf162, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf162 BINDING SITE, designated SEQ ID:27919, to the nucleotide sequence of VGAM1710 RNA, herein designated VGAM RNA, also designated SEQ ID:4421.

[57641] Another function of VGAM1710 is therefore inhibition of Chromosome 20 Open Reading Frame 162 (C20orf162, Accession NM\_080603). Accordingly, utilities of VGAM1710 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf162. FLJ20297 (Accession NM\_017951) is another VGAM1710 host target gene. FLJ20297 BINDING SITE1 and FLJ20297 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ20297, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20297 BINDING SITE1 and FLJ20297 BINDING SITE2, designated SEQ ID:19653 and SEQ ID:19361 respectively, to the nucleotide sequence of VGAM1710 RNA, herein designated VGAM RNA, also designated SEQ ID:4421.

[57642] Another function of VGAM1710 is therefore inhibition of FLJ20297 (Accession NM\_017951). Accordingly, utilities of VGAM1710 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20297. ZER6 (Accession XM\_032742) is another VGAM1710 host target gene. ZER6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZER6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZER6 BINDING SITE, designated SEQ ID:31744, to the nucleotide sequence of VGAM1710 RNA, herein designated VGAM RNA, also designated SEQ ID:4421.

[57643] Another function of VGAM1710 is therefore inhibition of ZER6 (Accession XM\_032742). Accordingly, utilities of VGAM1710 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with ZER6. LOC126661 (Accession XM\_059061) is another VGAM1710 host target gene. LOC126661 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC126661, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126661 BINDING SITE, designated SEQ ID:36848, to the nucleotide sequence of VGAM1710 RNA, herein designated VGAM RNA, also designated SEQ ID:4421.

[57644] Another function of VGAM1710 is therefore inhibition of LOC126661 (Accession XM\_059061). Accordingly, utilities of VGAM1710 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126661. LOC144467 (Accession NM\_138473) is another VGAM1710 host target gene. LOC144467 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC144467, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144467 BINDING SITE, designated SEQ ID:28821, to

the nucleotide sequence of VGAM1710 RNA, herein designated VGAM RNA, also designated SEQ ID:4421.

[57645] Another function of VGAM1710 is therefore inhibition of LOC144467 (Accession NM\_138473). Accordingly, utilities of VGAM1710 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144467. LOC149830 (Accession XM\_097746) is another VGAM1710 host target gene. LOC149830 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149830, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149830 BINDING SITE, designated SEQ ID:41095, to the nucleotide sequence of VGAM1710 RNA, herein designated VGAM RNA, also designated SEQ ID:4421.

[57646] Another function of VGAM1710 is therefore inhibition of LOC149830 (Accession XM\_097746). Accordingly, utilities of VGAM1710 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149830. LOC150776 (Accession XM\_032542) is another VGAM1710 host target gene. LOC150776 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC150776, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150776 BINDING SITE, designated SEQ ID:31679, to the nucleotide sequence of VGAM1710 RNA, herein designated VGAM RNA, also designated SEQ ID:4421.

[57647] Another function of VGAM1710 is therefore inhibition of LOC150776 (Accession XM\_032542). Accordingly, utilities of VGAM1710 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150776. LOC152359 (Accession XM\_098213) is another VGAM1710 host target gene. LOC152359 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152359, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152359 BINDING SITE, designated SEQ ID:41491, to the nucleotide sequence of VGAM1710 RNA, herein designated VGAM RNA, also designated SEQ ID:4421.

[57648] Another function of VGAM1710 is therefore inhibition of LOC152359 (Accession XM\_098213). Accordingly, utilities

of VGAM1710 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152359. LOC154930 (Accession XM\_088080) is another VGAM1710 host target gene. LOC154930 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154930, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154930 BINDING SITE, designated SEQ ID:39506, to the nucleotide sequence of VGAM1710 RNA, herein designated VGAM RNA, also designated SEQ ID:4421.

[57649] Another function of VGAM1710 is therefore inhibition of LOC154930 (Accession XM\_088080). Accordingly, utilities of VGAM1710 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154930. LOC221103 (Accession XM\_167758) is another VGAM1710 host target gene. LOC221103 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221103, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC221103 BINDING SITE, designated SEQ ID:44778, to the nucleotide sequence of VGAM1710 RNA, herein designated VGAM RNA, also designated SEQ ID:4421.

[57650] Another function of VGAM1710 is therefore inhibition of LOC221103 (Accession XM\_167758). Accordingly, utilities of VGAM1710 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221103. LOC253120 (Accession XM\_172575) is another VGAM1710 host target gene. LOC253120 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253120, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253120 BINDING SITE, designated SEQ ID:46076, to the nucleotide sequence of VGAM1710 RNA, herein designated VGAM RNA, also designated SEQ ID:4421.

[57651] Another function of VGAM1710 is therefore inhibition of LOC253120 (Accession XM\_172575). Accordingly, utilities of VGAM1710 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253120. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 1711 (VGAM1711) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[57652] VGAM1711 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1711 was detected is described hereinabove with reference to Figs. 1–8.

[57653] VGAM1711 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Semliki Forest Virus. VGAM1711 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[57654] VGAM1711 gene encodes a VGAM1711 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1711 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1711 precursor RNA is designated SEQ ID:1697, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1697 is located at position 4081 relative to the

genome of Semliki Forest Virus.

[57655] VGAM1711 precursor RNA folds onto itself, forming VGAM1711 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[57656] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1711 folded precursor RNA into VGAM1711 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1711 RNA is designated SEQ ID:4422, and is provided hereinbelow with reference to the sequence listing part.

[57657] VGAM1711 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1711 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1711 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[57658] VGAM1711 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1711 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1711 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1711 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1711 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[57659] The complementary binding of VGAM1711 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1711 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1711 host target RNA into VGAM1711 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[57660] It is appreciated that VGAM1711 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1711 host target genes. The mRNA of each one of this plurality of VGAM1711 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1711 RNA, herein designated VGAM RNA, and which when bound by VGAM1711 RNA causes inhibition of translation of respective one or more VGAM1711 host target proteins.

[57661] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1711 gene, herein designated VGAM GENE, on one or more VGAM1711 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[57662] It is yet further appreciated that a function of VGAM1711 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of viral infection by Semliki Forest Virus. Specific functions, and accordingly utilities, of VGAM1711

correlate with, and may be deduced from, the identity of the host target genes which VGAM1711 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[57663] Nucleotide sequences of the VGAM1711 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1711 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1711 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1711 are further described hereinbelow with reference to Table 1.

[57664] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1711 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1711 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[57665] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1711 gene, herein designated VGAM is inhibition of expression of VGAM1711 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1711 correlate with, and may be deduced

from, the identity of the target genes which VGAM1711 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[57666] Adenylate Cyclase 2 (brain) (ADCY2, Accession XM\_036383) is a VGAM1711 host target gene. ADCY2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADCY2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADCY2 BINDING SITE, designated SEQ ID:32434, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57667] A function of VGAM1711 is therefore inhibition of Adenylate Cyclase 2 (brain) (ADCY2, Accession XM\_036383), a gene which Adenylate cyclase (type 2), an ATP-pyrophosphate lyase; converts ATP to cAMP. Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADCY2. The function of ADCY2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM120. Apolipoprotein L, 1 (APOL1,

Accession NM\_003661) is another VGAM1711 host target gene. APOL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by APOL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APOL1 BINDING SITE, designated SEQ ID:9733, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57668] Another function of VGAM1711 is therefore inhibition of Apolipoprotein L, 1 (APOL1, Accession NM\_003661), a gene which may participate in reverse cholesterol transport from peripheral cells to the liver. Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APOL1. The function of APOL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM235. Activating Transcription Factor 5 (ATF5, Accession NM\_012068) is another VGAM1711 host target gene. ATF5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by ATF5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATF5 BINDING SITE, designated SEQ ID:14321, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57669] Another function of VGAM1711 is therefore inhibition of Activating Transcription Factor 5 (ATF5, Accession NM\_012068), a gene which binds to cAMP-inducible promoters and is involved in gene transcription. Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATF5. The function of ATF5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM588. Carbohydrate (N-acetylglucosamine 6-O) Sulfotransferase 5 (CHST5, Accession NM\_012126) is another VGAM1711 host target gene. CHST5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHST5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of CHST5 BINDING SITE, designated SEQ ID:14440, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57670] Another function of VGAM1711 is therefore inhibition of Carbohydrate (N-acetylglucosamine 6-O) Sulfotransferase 5 (CHST5, Accession NM\_012126), a gene which may be involved in sulfation of glycoproteins and proteoglycans. Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHST5. The function of CHST5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM186. Cryptochrome 2 (photolyase-like) (CRY2, Accession XM\_051030) is another VGAM1711 host target gene. CRY2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CRY2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRY2 BINDING SITE, designated SEQ ID:35732,

to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57671] Another function of VGAM1711 is therefore inhibition of Cryptochrome 2 (photolyase-like) (CRY2, Accession XM\_051030), a gene which has a role in circadian photoreception in mammals. Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRY2. The function of CRY2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1223. EGF-like-domain, Multiple 5 (EGFL5, Accession XM\_098838) is another VGAM1711 host target gene. EGFL5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EGFL5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGFL5 BINDING SITE, designated SEQ ID:41883, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57672] Another function of VGAM1711 is therefore inhibition of

EGF-like-domain, Multiple 5 (EGFL5, Accession XM\_098838). Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGFL5. Glutamine-fructose-6-phosphate Transaminase 2 (GFPT2, Accession NM\_005110) is another VGAM1711 host target gene. GFPT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GFPT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GFPT2 BINDING SITE, designated SEQ ID:11593, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57673] Another function of VGAM1711 is therefore inhibition of Glutamine-fructose-6-phosphate Transaminase 2 (GFPT2, Accession NM\_005110). Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GFPT2. Glucagon-like Peptide 1 Receptor (GLP1R, Accession NM\_002062) is another VGAM1711 host target gene. GLP1R BINDING SITE is HOST TARGET binding site found

in the 3` untranslated region of mRNA encoded by GLP1R, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GLP1R BINDING SITE, designated SEQ ID:7826, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57674] Another function of VGAM1711 is therefore inhibition of Glucagon-like Peptide 1 Receptor (GLP1R, Accession NM\_002062), a gene which is mediated by g proteins which activate adenylyl cyclase. Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GLP1R. The function of GLP1R and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1652. Interleukin-1 Receptor-associated Kinase 1 (IRAK1, Accession NM\_001569) is another VGAM1711 host target gene. IRAK1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IRAK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of IRAK1 BINDING SITE, designated SEQ ID:7300, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57675] Another function of VGAM1711 is therefore inhibition of Interleukin-1 Receptor-associated Kinase 1 (IRAK1, Accession NM\_001569). Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IRAK1. Kinesin Family Member 3B (KIF3B, Accession NM\_004798) is another VGAM1711 host target gene. KIF3B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIF3B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIF3B BINDING SITE, designated SEQ ID:11217, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57676] Another function of VGAM1711 is therefore inhibition of Kinesin Family Member 3B (KIF3B, Accession NM\_004798), a gene which is a microtubule-based anterograde translocator for membranous organelles. Accordingly, utilities of

VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIF3B. The function of KIF3B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1017. Leptin (obesity homolog, mouse) (LEP, Accession NM\_000230) is another VGAM1711 host target gene. LEP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LEP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LEP BINDING SITE, designated SEQ ID:5740, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57677] Another function of VGAM1711 is therefore inhibition of Leptin (obesity homolog, mouse) (LEP, Accession NM\_000230). Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LEP. LIM Homeobox Protein 1 (LHX1, Accession NM\_005568) is another VGAM1711 host target gene. LHX1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA

encoded by LHX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LHX1 BINDING SITE, designated SEQ ID:12093, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57678] Another function of VGAM1711 is therefore inhibition of LIM Homeobox Protein 1 (LHX1, Accession NM\_005568). Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LHX1. LIM Domain Only 2 (rhombotin-like 1) (LMO2, Accession NM\_005574) is another VGAM1711 host target gene. LMO2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LMO2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LMO2 BINDING SITE, designated SEQ ID:12102, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57679] Another function of VGAM1711 is therefore inhibition of

LIM Domain Only 2 (rhombotin-like 1) (LMO2, Accession NM\_005574). Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LMO2. Myelin Oligodendrocyte Glycoprotein (MOG, Accession NM\_002433) is another VGAM1711 host target gene. MOG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MOG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MOG BINDING SITE, designated SEQ ID:8279, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57680] Another function of VGAM1711 is therefore inhibition of Myelin Oligodendrocyte Glycoprotein (MOG, Accession NM\_002433). Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MOG. Paired-like Homeodomain Transcription Factor 3 (PITX3, Accession NM\_005029) is another VGAM1711 host target gene. PITX3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PITX3,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PITX3 BINDING SITE, designated SEQ ID:11470, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57681] Another function of VGAM1711 is therefore inhibition of Paired-like Homeodomain Transcription Factor 3 (PITX3, Accession NM\_005029), a gene which may play a role in normal anterior-chamber and lens development. Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PITX3. The function of PITX3 has been established by previous studies. The PITX3 gene is the human homolog of the mouse Pitx3 gene and is a member of the RIEG/PITX homeo box gene family. The protein encoded by PITX3 shows 99% amino acid identity to the mouse Pitx3 protein, with 100% identity in the homeodomain and approximately 70% overall identity to other members of this family. Semina et al. (1998) screened a collection of 80 DNA samples from individuals with various eye anomalies for mutations in the PITX3 gene. A mutation was identified in each of 2 unrelated patients. The 17-bp

insertion in the 3-prime end of the coding sequence, resulting in a frameshift (602669.0001), occurred in a patient with anterior segment mesenchymal dysgenesis (ASMD; 107250) and cataracts; a G-to-A substitution in the 5-prime end of the gene, changing a codon for serine into a codon for asparagine (602669.0002), occurred in a patient with congenital cataracts. Each mutation cosegregated with the disease phenotype in families and was not found in up to 300 control individuals studied. Further expression analysis of Pitx3 in the mouse supported a unique role in early ocular development, with later expression extending to the midbrain, tongue, incisors, sternum, vertebrae, and limbs. The findings strongly suggested the role of PITX3 in ASMD and cataracts and provided new evidence of the contribution of the RIEG/PITX gene family to the developmental program underpinning normal eye formation. The PTX1 (OMIM Ref. No. 601542), PTX2 (OMIM Ref. No. 602149), and PTX3 genes define a novel family of transcription factors, the PTX subfamily, within the paired-like class of homeodomain factors. In mice, Ptx1 and Ptx2 gene expression has been detected in the area of the pituitary primordium and is maintained throughout development in the Rathke pouch and adult

pituitary. Pellegrini-Bouiller et al. (1999) characterized the expression of the PTX1, PTX2, and PTX3 genes in the normal human pituitary and in the different types of human pituitary adenomas. RT-PCR analysis detected no PTX3 expression in adult and fetal normal human pituitary, although a specific band was readily amplified from fetal mesencephalon, a tissue known to express this gene. Animal model experiments lend further support to the function of PITX3. Mouse 'aphakia' (ak) is a recessive phenotype that spontaneously occurs in the 129/Sv-SIJ strain and is characterized by small eyes that lack a lens. Semina et al. (1997) determined that the Pitx3 gene is expressed in the developing lens and maps to chromosome 19, close to ak in mouse. In further studies, Semina et al. (2000) did not detect by in situ hybridization Pitx3 transcripts in ak/ak mice, either in the lens placode or at later developmental stages of the lens. Although no differences were previously found between ak/ak and wildtype sequences in the Pitx3 coding region, the authors identified a deletion of 652 bp located 2.5 kb upstream from the start point of the Pitx3 5-prime untranslated region sequence in ak/ak mice. The deletion cosegregated with the ak mutation and was not detected in 16 samples from 10 differ-

ent mouse strains, including the founder strains. Analysis of the 652-bp region identified sequences similar to consensus binding sites for transcription factors AP2 (see OMIM Ref. No. 107580) and Maf (see OMIM Ref. No. 177075) that were shown to play a critical role in lens determination. The authors concluded that the abnormal ocular development in the aphakia mouse is due to the deletion upstream of the Pitx3 gene.

[57682] It is appreciated that the abovementioned animal model for PITX3 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[57683] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[57684] Semina, E. V.; Ferrell, R. E.; Mintz-Hittner, H. A.; Bitoun, P.; Alward, W. L. M.; Reiter, R. S.; Funkhauser, C.; Daack-Hirsch, S.; Murray, J. C. : A novel homeobox gene PITX3 is mutated in families with autosomal-dominant cataracts and ASMD. *Nature Genet.* 19: 167-170, 1998. ; and

[57685] Semina, E. V.; Murray, J. C.; Reiter, R.; Hrstka, R. F.; Graw, J. : Deletion in the promoter region and altered expression of Pitx3 homeobox gene in aphakia mice. *Hum. Molec.*

Genet. 9:.

[57686] Further studies establishing the function and utilities of PITX3 are found in John Hopkins OMIM database record ID 602669, and in cited publications numbered 876 and 8944–8764 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Suppression of Tumorigenicity 5 (ST5, Accession NM\_005418) is another VGAM1711 host target gene. ST5 BINDING SITE1 and ST5 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ST5, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ST5 BINDING SITE1 and ST5 BINDING SITE2, designated SEQ ID:11889 and SEQ ID:29169 respectively, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57687] Another function of VGAM1711 is therefore inhibition of Suppression of Tumorigenicity 5 (ST5, Accession NM\_005418), a gene which preferentially binds to the SH3 domain of c-Abl kinase, and acts as a regulator of MAPK1/ERK2 kinase. Accordingly, utilities of VGAM1711

include diagnosis, prevention and treatment of diseases and clinical conditions associated with ST5. The function of ST5 has been established by previous studies. The tumorigenicity of HeLa cells in nude mice can be suppressed by the addition of a normal human chromosome 11 in somatic cell hybrids (Stanbridge, 1976; Klinger, 1980); see 191181 for description of a tumor-suppressor gene located on 11q. Lichy et al. (1992) isolated a HeLa cell line that displayed morphologic features of the nontumorigenic hybrids, demonstrated reduced tumorigenicity in nude mice, and showed an 85% reduction in alkaline phosphatase, a consistent marker of the tumorigenic phenotype in these cells. This cell line, designated F2, contained a single exogenous cDNA, which was recovered by polymerase chain reaction (PCR) and designated HTS1 because of its probable association with 'HeLa tumor suppression.' In nontumorigenic hybrids, RNA species of 2.8, 3.1, and 4.6 kb were identified. In 2 tumorigenic hybrid lines, the 2.8-kb species was markedly reduced or absent. Whereas 3 nontumorigenic human keratinocyte lines expressed all 3 RNA species, several tumorigenic cervical carcinoma cell lines lacked the 2.8-kb species. The HTS1 gene was localized to 11p15 by in situ hybridization, con-

firming the assignment to chromosome 11 by somatic cell hybrid analysis. Lichy et al. (1992) reviewed previous evidence indicating the presence of a tumor suppressor gene in the 11p15 region; see 194071 and 185440.

[57688] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[57689] Lichy, J. H.; Modi, W. S.; Seuanez, H. N.; Howley, P. M. : Identification of a human chromosome 11 gene which is differentially regulated in tumorigenic and nontumorigenic somatic cell hybrids of HeLa cells. *Cell Growth Differ.* 3: 541–548, 1992. ; and

[57690] Stanbridge, E. J. : Suppression of malignancy in human cells. *Nature* 260: 17–20, 1976.

[57691] Further studies establishing the function and utilities of ST5 are found in John Hopkins OMIM database record ID 140750, and in cited publications numbered 12003–12005 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. 1-acylglycerol-3-phosphate O-acyltransferase 1 (lysophosphatidic acid acyltransferase, alpha) (AGPAT1, Accession NM\_032741) is another VGAM1711 host target gene. AGPAT1 BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by AGPAT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AGPAT1 BINDING SITE, designated SEQ ID:26473, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57692] Another function of VGAM1711 is therefore inhibition of 1-acylglycerol-3-phosphate O-acyltransferase 1 (lysophosphatidic acid acyltransferase, alpha) (AGPAT1, Accession NM\_032741). Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AGPAT1. Aldo-keto Reductase Family 1, Member D1 (delta 4-3-ketosteroid-5-beta-reductase) (AKR1D1, Accession NM\_005989) is another VGAM1711 host target gene. AKR1D1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AKR1D1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKR1D1 BINDING SITE, designated SEQ

ID:12611, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57693] Another function of VGAM1711 is therefore inhibition of Aldo-keto Reductase Family 1, Member D1 (delta 4-3-ketosteroid-5-beta-reductase) (AKR1D1, Accession NM\_005989). Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKR1D1. Chromosome 20 Open Reading Frame 20 (C20orf20, Accession NM\_018270) is another VGAM1711 host target gene. C20orf20 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf20, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf20 BINDING SITE, designated SEQ ID:20245, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57694] Another function of VGAM1711 is therefore inhibition of Chromosome 20 Open Reading Frame 20 (C20orf20, Accession NM\_018270). Accordingly, utilities of VGAM1711

include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf20.

FLJ10547 (Accession NM\_018134) is another VGAM1711 host target gene. FLJ10547 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10547, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10547 BINDING SITE, designated SEQ ID:19931, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57695] Another function of VGAM1711 is therefore inhibition of FLJ10547 (Accession NM\_018134). Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10547. FLJ11577 (Accession NM\_025159) is another VGAM1711 host target gene. FLJ11577 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11577, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11577

BINDING SITE, designated SEQ ID:24800, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57696] Another function of VGAM1711 is therefore inhibition of FLJ11577 (Accession NM\_025159). Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11577. FLJ20079 (Accession NM\_017656) is another VGAM1711 host target gene. FLJ20079 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20079, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20079 BINDING SITE, designated SEQ ID:19174, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57697] Another function of VGAM1711 is therefore inhibition of FLJ20079 (Accession NM\_017656). Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20079. FLJ20306 (Accession NM\_017756) is another VGAM1711 host target gene. FLJ20306 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20306, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20306 BINDING SITE, designated SEQ ID:19369, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57698] Another function of VGAM1711 is therefore inhibition of FLJ20306 (Accession NM\_017756). Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20306. FLJ22167 (Accession NM\_024533) is another VGAM1711 host target gene. FLJ22167 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22167, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22167 BINDING SITE, designated SEQ ID:23742, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57699] Another function of VGAM1711 is therefore inhibition of

FLJ22167 (Accession NM\_024533). Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22167. FLJ22615 (Accession XM\_043654) is another VGAM1711 host target gene. FLJ22615 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22615, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22615 BINDING SITE, designated SEQ ID:33991, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57700] Another function of VGAM1711 is therefore inhibition of FLJ22615 (Accession XM\_043654). Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22615. FLJ22635 (Accession NM\_025092) is another VGAM1711 host target gene. FLJ22635 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22635, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of FLJ22635 BINDING SITE, designated SEQ ID:24717, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57701] Another function of VGAM1711 is therefore inhibition of FLJ22635 (Accession NM\_025092). Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22635. FLJ22814 (Accession NM\_024916) is another VGAM1711 host target gene. FLJ22814 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22814, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22814 BINDING SITE, designated SEQ ID:24442, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57702] Another function of VGAM1711 is therefore inhibition of FLJ22814 (Accession NM\_024916). Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22814. Glycoprotein A33 (transmembrane) (GPA33, Ac-

cession NM\_005814) is another VGAM1711 host target gene. GPA33 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPA33, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPA33 BINDING SITE, designated SEQ ID:12404, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57703] Another function of VGAM1711 is therefore inhibition of Glycoprotein A33 (transmembrane) (GPA33, Accession NM\_005814). Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPA33. HSRNAFEV (Accession NM\_017521) is another VGAM1711 host target gene. HSRNAFEV BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HSRNAFEV, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSRNAFEV BINDING SITE, designated SEQ ID:18969, to the nucleotide sequence of

VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57704] Another function of VGAM1711 is therefore inhibition of HSRNAFEV (Accession NM\_017521). Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSRNAFEV. KIAA0057 (Accession NM\_012288) is another VGAM1711 host target gene. KIAA0057 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0057, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0057 BINDING SITE, designated SEQ ID:14621, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57705] Another function of VGAM1711 is therefore inhibition of KIAA0057 (Accession NM\_012288). Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0057. KIAA0284 (Accession XM\_032235) is another VGAM1711 host target gene. KIAA0284 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA0284, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0284 BINDING SITE, designated SEQ ID:31618, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57706] Another function of VGAM1711 is therefore inhibition of KIAA0284 (Accession XM\_032235). Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0284. KIAA0710 (Accession NM\_014871) is another VGAM1711 host target gene. KIAA0710 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0710, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0710 BINDING SITE, designated SEQ ID:16992, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57707] Another function of VGAM1711 is therefore inhibition of KIAA0710 (Accession NM\_014871). Accordingly, utilities

of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0710. KIAA0716 (Accession NM\_014705) is another VGAM1711 host target gene. KIAA0716 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0716, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0716 BINDING SITE, designated SEQ ID:16247, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57708] Another function of VGAM1711 is therefore inhibition of KIAA0716 (Accession NM\_014705). Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0716. KIAA1228 (Accession XM\_036408) is another VGAM1711 host target gene. KIAA1228 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1228, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1228 BINDING SITE, designated SEQ ID:32446, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57709] Another function of VGAM1711 is therefore inhibition of KIAA1228 (Accession XM\_036408). Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1228. KIAA1969 (Accession XM\_086098) is another VGAM1711 host target gene. KIAA1969 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1969, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1969 BINDING SITE, designated SEQ ID:38492, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57710] Another function of VGAM1711 is therefore inhibition of KIAA1969 (Accession XM\_086098). Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1969. MGC2452 (Accession NM\_032644) is another VGAM1711 host target gene. MGC2452 BINDING SITE is

HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC2452, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2452 BINDING SITE, designated SEQ ID:26371, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57711] Another function of VGAM1711 is therefore inhibition of MGC2452 (Accession NM\_032644). Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2452. Mitochondrial Ribosomal Protein 63 (MRP63, Accession NM\_024026) is another VGAM1711 host target gene. MRP63 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MRP63, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MRP63 BINDING SITE, designated SEQ ID:23456, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57712] Another function of VGAM1711 is therefore inhibition of Mitochondrial Ribosomal Protein 63 (MRP63, Accession NM\_024026). Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRP63. Mitochondrial Ribosomal Protein L20 (MRPL20, Accession NM\_017971) is another VGAM1711 host target gene. MRPL20 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MRPL20, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MRPL20 BINDING SITE, designated SEQ ID:19697, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57713] Another function of VGAM1711 is therefore inhibition of Mitochondrial Ribosomal Protein L20 (MRPL20, Accession NM\_017971). Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPL20. Neuronal Guanine Nucleotide Exchange Factor (NGEF, Accession XM\_044799) is another VGAM1711 host target gene. NGEF BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by NGEF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NGEF BINDING SITE, designated SEQ ID:34277, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57714] Another function of VGAM1711 is therefore inhibition of Neuronal Guanine Nucleotide Exchange Factor (NGEF, Accession XM\_044799). Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NGEF. PRO0529 (Accession NM\_014074) is another VGAM1711 host target gene. PRO0529 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO0529, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0529 BINDING SITE, designated SEQ ID:15299, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57715] Another function of VGAM1711 is therefore inhibition of

PRO0529 (Accession NM\_014074). Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0529. Protein Tyrosine Phosphatase, Receptor Type, U (PTPRU, Accession NM\_133177) is another VGAM1711 host target gene. PTPRU BINDING SITE1 through PTPRU BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PTPRU, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPRU BINDING SITE1 through PTPRU BINDING SITE3, designated SEQ ID:28401, SEQ ID:28406 and SEQ ID:12256 respectively, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[577<sup>16</sup>] Another function of VGAM1711 is therefore inhibition of Protein Tyrosine Phosphatase, Receptor Type, U (PTPRU, Accession NM\_133177). Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRU. Polymerase I and Transcript Release Factor (PTRF, Accession XM\_032852) is another VGAM1711 host target gene.

PTRF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTRF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTRF BINDING SITE, designated SEQ ID:31783, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57717] Another function of VGAM1711 is therefore inhibition of Polymerase I and Transcript Release Factor (PTRF, Accession XM\_032852). Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTRF. Smith-Magenis Syndrome Chromosome Region, Candidate 5 (SMCR5, Accession NM\_144774) is another VGAM1711 host target gene. SMCR5 BINDING SITE1 and SMCR5 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SMCR5, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMCR5 BINDING SITE1 and SMCR5 BINDING SITE2, designated SEQ ID:29563 and SEQ ID:29564 respectively, to the nu-

cleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57718] Another function of VGAM1711 is therefore inhibition of Smith–Magenis Syndrome Chromosome Region, Candidate 5 (SMCR5, Accession NM\_144774). Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMCR5. UBCE7IP5 (Accession NM\_014948) is another VGAM1711 host target gene. UBCE7IP5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by UBCE7IP5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBCE7IP5 BINDING SITE, designated SEQ ID:17272, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57719] Another function of VGAM1711 is therefore inhibition of UBCE7IP5 (Accession NM\_014948). Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBCE7IP5. Zinc Finger Protein 212 (ZNF212, Accession NM\_012256) is another VGAM1711 host target gene.

ZNF212 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF212, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF212 BINDING SITE, designated SEQ ID:14558, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57720] Another function of VGAM1711 is therefore inhibition of Zinc Finger Protein 212 (ZNF212, Accession NM\_012256). Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF212. LOC134147 (Accession NM\_138809) is another VGAM1711 host target gene. LOC134147 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC134147, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC134147 BINDING SITE, designated SEQ ID:29032, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4422.

[57721] Another function of VGAM1711 is therefore inhibition of LOC134147 (Accession NM\_138809). Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC134147. LOC138307 (Accession XM\_059963) is another VGAM1711 host target gene. LOC138307 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC138307, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC138307 BINDING SITE, designated SEQ ID:37123, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57722] Another function of VGAM1711 is therefore inhibition of LOC138307 (Accession XM\_059963). Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC138307. LOC145195 (Accession XM\_096731) is another VGAM1711 host target gene. LOC145195 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145195, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145195 BINDING SITE, designated SEQ ID:40513, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57723] Another function of VGAM1711 is therefore inhibition of LOC145195 (Accession XM\_096731). Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145195. LOC146780 (Accession XM\_097086) is another VGAM1711 host target gene. LOC146780 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146780, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146780 BINDING SITE, designated SEQ ID:40743, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57724] Another function of VGAM1711 is therefore inhibition of LOC146780 (Accession XM\_097086). Accordingly, utilities of VGAM1711 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC146780. LOC150935 (Accession XM\_087049) is another VGAM1711 host target gene. LOC150935 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC150935, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150935 BINDING SITE, designated SEQ ID:39020, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57725] Another function of VGAM1711 is therefore inhibition of LOC150935 (Accession XM\_087049). Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150935. LOC152804 (Accession XM\_098266) is another VGAM1711 host target gene. LOC152804 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC152804, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152804 BINDING SITE, designated SEQ ID:41556, to

the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57726] Another function of VGAM1711 is therefore inhibition of LOC152804 (Accession XM\_098266). Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152804. LOC162137 (Accession XM\_102426) is another VGAM1711 host target gene. LOC162137 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC162137, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC162137 BINDING SITE, designated SEQ ID:42115, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57727] Another function of VGAM1711 is therefore inhibition of LOC162137 (Accession XM\_102426). Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC162137. LOC166867 (Accession XM\_094142) is another VGAM1711 host target gene. LOC166867 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC166867, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC166867 BINDING SITE, designated SEQ ID:40223, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57728] Another function of VGAM1711 is therefore inhibition of LOC166867 (Accession XM\_094142). Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC166867. LOC197201 (Accession XM\_113839) is another VGAM1711 host target gene. LOC197201 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC197201, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197201 BINDING SITE, designated SEQ ID:42464, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57729] Another function of VGAM1711 is therefore inhibition of LOC197201 (Accession XM\_113839). Accordingly, utilities

of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197201. LOC199957 (Accession XM\_114068) is another VGAM1711 host target gene. LOC199957 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199957, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199957 BINDING SITE, designated SEQ ID:42675, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57730] Another function of VGAM1711 is therefore inhibition of LOC199957 (Accession XM\_114068). Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199957. LOC202052 (Accession XM\_117355) is another VGAM1711 host target gene. LOC202052 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC202052, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC202052 BINDING SITE, designated SEQ ID:43408, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57731] Another function of VGAM1711 is therefore inhibition of LOC202052 (Accession XM\_117355). Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202052. LOC203042 (Accession XM\_117490) is another VGAM1711 host target gene. LOC203042 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC203042, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203042 BINDING SITE, designated SEQ ID:43475, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57732] Another function of VGAM1711 is therefore inhibition of LOC203042 (Accession XM\_117490). Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203042. LOC219722 (Accession XM\_167593) is another VGAM1711 host target gene. LOC219722 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC219722, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219722 BINDING SITE, designated SEQ ID:44709, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57733] Another function of VGAM1711 is therefore inhibition of LOC219722 (Accession XM\_167593). Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219722. LOC221271 (Accession XM\_166307) is another VGAM1711 host target gene. LOC221271 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221271, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221271 BINDING SITE, designated SEQ ID:44125, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57734] Another function of VGAM1711 is therefore inhibition of

LOC221271 (Accession XM\_166307). Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221271. LOC221410 (Accession XM\_166373) is another VGAM1711 host target gene. LOC221410 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221410, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221410 BINDING SITE, designated SEQ ID:44195, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57735] Another function of VGAM1711 is therefore inhibition of LOC221410 (Accession XM\_166373). Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221410. LOC90509 (Accession XM\_032209) is another VGAM1711 host target gene. LOC90509 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90509, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of LOC90509 BINDING SITE, designated SEQ ID:31608, to the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, also designated SEQ ID:4422.

[57736] Another function of VGAM1711 is therefore inhibition of LOC90509 (Accession XM\_032209). Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90509. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1712 (VGAM1712) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[57737] VGAM1712 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1712 was detected is described hereinabove with reference to Figs. 1–8.

[57738] VGAM1712 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sindbis Virus.

VGAM1712 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[57739] VGAM1712 gene encodes a VGAM1712 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1712 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1712 precursor RNA is designated SEQ ID:1698, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1698 is located at position 8817 relative to the genome of Sindbis Virus.

[57740] VGAM1712 precursor RNA folds onto itself, forming VGAM1712 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[57741] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1712 folded precursor RNA into VGAM1712 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1712 RNA is designated SEQ ID:4423, and is provided hereinbelow with reference to the sequence listing part.

[57742] VGAM1712 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1712 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1712 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[57743] VGAM1712 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1712 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1712 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1712 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1712 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[57744] The complementary binding of VGAM1712 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1712 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1712 host target RNA into VGAM1712 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[57745] It is appreciated that VGAM1712 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1712 host target genes. The mRNA of each one of this plurality of VGAM1712 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1712 RNA, herein designated VGAM RNA, and which when bound by VGAM1712 RNA causes inhibition of translation of respective one or more VGAM1712 host target proteins.

[57746] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1712 gene, herein designated VGAM GENE, on one or more VGAM1712 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[57747] It is yet further appreciated that a function of VGAM1712 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1712 include diagnosis, prevention and treatment of viral infection by Sindbis Virus. Specific functions, and accordingly utilities, of VGAM1712 correlate with, and may be deduced from, the identity of the host target genes which VGAM1712 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[57748] Nucleotide sequences of the VGAM1712 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1712 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1712 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1712 are further described hereinbelow with reference to Table 1.

[57749] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM1712 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1712 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[57750] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1712 gene, herein designated VGAM is inhibition of expression of VGAM1712 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1712 correlate with, and may be deduced from, the identity of the target genes which VGAM1712 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[57751] EphB3 (EPHB3, Accession NM\_004443) is a VGAM1712 host target gene. EPHB3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EPHB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPHB3 BINDING SITE, designated SEQ ID:10736, to the nucleotide sequence of VGAM1712 RNA, herein designated VGAM RNA, also designated SEQ ID:4423.

[57752] A function of VGAM1712 is therefore inhibition of EphB3 (EPHB3, Accession NM\_004443), a gene which receptor for members of the ephrin-b family. binds to ephrin-b1 and -b2. Accordingly, utilities of VGAM1712 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPHB3. The function of EPHB3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM455. Heat Shock 70kDa Protein 9B (mortalin-2) (HSPA9B, Accession NM\_004134) is another VGAM1712 host target gene. HSPA9B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSPA9B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPA9B BINDING SITE, designated SEQ ID:10347, to the nucleotide sequence of VGAM1712 RNA, herein designated VGAM RNA, also designated SEQ ID:4423.

[57753] Another function of VGAM1712 is therefore inhibition of Heat Shock 70kDa Protein 9B (mortalin-2) (HSPA9B, Accession NM\_004134). Accordingly, utilities of VGAM1712

include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPA9B. Chromosome 1 Open Reading Frame 24 (C1orf24, Accession NM\_052966) is another VGAM1712 host target gene. C1orf24 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C1orf24, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf24 BINDING SITE, designated SEQ ID:27533, to the nucleotide sequence of VGAM1712 RNA, herein designated VGAM RNA, also designated SEQ ID:4423.

[57754] Another function of VGAM1712 is therefore inhibition of Chromosome 1 Open Reading Frame 24 (C1orf24, Accession NM\_052966). Accordingly, utilities of VGAM1712 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf24. NIBAN (Accession NM\_022083) is another VGAM1712 host target gene. NIBAN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NIBAN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of NIBAN BINDING SITE, designated SEQ ID:22630, to the nucleotide sequence of VGAM1712 RNA, herein designated VGAM RNA, also designated SEQ ID:4423.

[57755] Another function of VGAM1712 is therefore inhibition of NIBAN (Accession NM\_022083). Accordingly, utilities of VGAM1712 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NIBAN. Zinc Finger Protein 84 (HPF2) (ZNF84, Accession NM\_003428) is another VGAM1712 host target gene. ZNF84 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ZNF84, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF84 BINDING SITE, designated SEQ ID:9479, to the nucleotide sequence of VGAM1712 RNA, herein designated VGAM RNA, also designated SEQ ID:4423.

[57756] Another function of VGAM1712 is therefore inhibition of Zinc Finger Protein 84 (HPF2) (ZNF84, Accession NM\_003428). Accordingly, utilities of VGAM1712 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NIBAN.

cal conditions associated with ZNF84. LOC256310 (Accession XM\_172813) is another VGAM1712 host target gene. LOC256310 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC256310, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256310 BINDING SITE, designated SEQ ID:46093, to the nucleotide sequence of VGAM1712 RNA, herein designated VGAM RNA, also designated SEQ ID:4423.

[57757] Another function of VGAM1712 is therefore inhibition of LOC256310 (Accession XM\_172813). Accordingly, utilities of VGAM1712 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256310. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1713 (VGAM1713) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[57758] VGAM1713 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1713 was detected is described hereinabove with reference to Figs. 1–8.

[57759] VGAM1713 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sindbis Virus.

VGAM1713 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[57760] VGAM1713 gene encodes a VGAM1713 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1713 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1713 precursor RNA is designated SEQ ID:1699, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1699 is located at position 8146 relative to the genome of Sindbis Virus.

[57761] VGAM1713 precursor RNA folds onto itself, forming VGAM1713 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[57762] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1713 folded precursor RNA into VGAM1713 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1713 RNA is designated SEQ ID:4424, and is provided hereinbelow with reference to the sequence listing part.

[57763] VGAM1713 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1713 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1713 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[57764] VGAM1713 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1713 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1713 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1713 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1713 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[57765] The complementary binding of VGAM1713 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1713 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1713 host target RNA into VGAM1713 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[57766] It is appreciated that VGAM1713 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1713 host target genes. The mRNA of each one of this plurality of VGAM1713 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1713 RNA, herein designated VGAM RNA, and which when bound by VGAM1713 RNA causes inhibition of translation of respective one or more VGAM1713 host target proteins.

[57767] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1713 gene, herein designated VGAM GENE, on one or more VGAM1713 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[57768] It is yet further appreciated that a function of VGAM1713 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1713 include diagnosis, prevention and treatment of viral infection by Sindbis Virus. Specific functions, and accordingly utilities, of VGAM1713 correlate with, and may be deduced from, the identity of the host target genes which VGAM1713 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[57769] Nucleotide sequences of the VGAM1713 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM1713 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1713 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1713 are further described hereinbelow with reference to Table 1.

[57770] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1713 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1713 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[57771] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1713 gene, herein designated VGAM is inhibition of expression of VGAM1713 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1713 correlate with, and may be deduced from, the identity of the target genes which VGAM1713 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[57772] ATP10C (Accession NM\_024490) is a VGAM1713 host target gene. ATP10C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by ATP10C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP10C BINDING SITE, designated SEQ ID:23687, to the nucleotide sequence of VGAM1713 RNA, herein designated VGAM RNA, also designated SEQ ID:4424.

[57773] A function of VGAM1713 is therefore inhibition of ATP10C (Accession NM\_024490), a gene which is phosphorylated in their intermediate state, drives uphill transport of ions across membranes. Accordingly, utilities of VGAM1713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP10C. The function of ATP10C and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM801. Phosphorylase Kinase, Beta (PHKB, Accession NM\_000293) is another VGAM1713 host target gene. PHKB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PHKB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of PHKB BINDING SITE, designated SEQ ID:5837, to the nucleotide sequence of VGAM1713 RNA, herein designated VGAM RNA, also designated SEQ ID:4424.

[57774] Another function of VGAM1713 is therefore inhibition of Phosphorylase Kinase, Beta (PHKB, Accession NM\_000293). Accordingly, utilities of VGAM1713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PHKB. Aminocarboxymuconate Semialdehyde Decarboxylase (acmsd, Accession NM\_138326) is another VGAM1713 host target gene. acmsd BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by acmsd, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of acmsd BINDING SITE, designated SEQ ID:28729, to the nucleotide sequence of VGAM1713 RNA, herein designated VGAM RNA, also designated SEQ ID:4424.

[57775] Another function of VGAM1713 is therefore inhibition of Aminocarboxymuconate Semialdehyde Decarboxylase (acmsd, Accession NM\_138326). Accordingly, utilities of VGAM1713 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with acmsd. Angiomotin (AMOT, Accession NM\_133265) is another VGAM1713 host target gene. AMOT BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AMOT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AMOT BINDING SITE, designated SEQ ID:28411, to the nucleotide sequence of VGAM1713 RNA, herein designated VGAM RNA, also designated SEQ ID:4424.

[57776] Another function of VGAM1713 is therefore inhibition of Angiomotin (AMOT, Accession NM\_133265). Accordingly, utilities of VGAM1713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AMOT. Butyrophilin, Subfamily 2, Member A2 (BTN2A2, Accession NM\_006995) is another VGAM1713 host target gene. BTN2A2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BTN2A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BTN2A2 BINDING SITE,

designated SEQ ID:13858, to the nucleotide sequence of VGAM1713 RNA, herein designated VGAM RNA, also designated SEQ ID:4424.

[57777] Another function of VGAM1713 is therefore inhibition of Butyrophilin, Subfamily 2, Member A2 (BTN2A2, Accession NM\_006995). Accordingly, utilities of VGAM1713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BTN2A2. DKFZP564D0462 (Accession XM\_047080) is another VGAM1713 host target gene. DKFZP564D0462 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564D0462, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564D0462 BINDING SITE, designated SEQ ID:34897, to the nucleotide sequence of VGAM1713 RNA, herein designated VGAM RNA, also designated SEQ ID:4424.

[57778] Another function of VGAM1713 is therefore inhibition of DKFZP564D0462 (Accession XM\_047080). Accordingly, utilities of VGAM1713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564D0462. Kv6.3 (Accession NM\_133490) is

another VGAM1713 host target gene. Kv6.3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by Kv6.3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Kv6.3 BINDING SITE, designated SEQ ID:28565, to the nucleotide sequence of VGAM1713 RNA, herein designated VGAM RNA, also designated SEQ ID:4424.

[57779] Another function of VGAM1713 is therefore inhibition of Kv6.3 (Accession NM\_133490). Accordingly, utilities of VGAM1713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Kv6.3. LOC149153 (Accession XM\_097599) is another VGAM1713 host target gene. LOC149153 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149153, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149153 BINDING SITE, designated SEQ ID:40964, to the nucleotide sequence of VGAM1713 RNA, herein designated VGAM RNA, also designated SEQ ID:4424.

[57780] Another function of VGAM1713 is therefore inhibition of LOC149153 (Accession XM\_097599). Accordingly, utilities of VGAM1713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149153. LOC150759 (Accession XM\_086995) is another VGAM1713 host target gene. LOC150759 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150759, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150759 BINDING SITE, designated SEQ ID:39012, to the nucleotide sequence of VGAM1713 RNA, herein designated VGAM RNA, also designated SEQ ID:4424.

[57781] Another function of VGAM1713 is therefore inhibition of LOC150759 (Accession XM\_086995). Accordingly, utilities of VGAM1713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150759. LOC151323 (Accession XM\_087168) is another VGAM1713 host target gene. LOC151323 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151323, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151323 BINDING SITE, designated SEQ ID:39101, to the nucleotide sequence of VGAM1713 RNA, herein designated VGAM RNA, also designated SEQ ID:4424.

[57782] Another function of VGAM1713 is therefore inhibition of LOC151323 (Accession XM\_087168). Accordingly, utilities of VGAM1713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151323. LOC200399 (Accession XM\_114226) is another VGAM1713 host target gene. LOC200399 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200399, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200399 BINDING SITE, designated SEQ ID:42809, to the nucleotide sequence of VGAM1713 RNA, herein designated VGAM RNA, also designated SEQ ID:4424.

[57783] Another function of VGAM1713 is therefore inhibition of LOC200399 (Accession XM\_114226). Accordingly, utilities of VGAM1713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC200399. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1714 (VGAM1714) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[57784] VGAM1714 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1714 was detected is described hereinabove with reference to Figs. 1–8.

[57785] VGAM1714 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sindbis Virus. VGAM1714 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[57786] VGAM1714 gene encodes a VGAM1714 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1714 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1714 precursor RNA is designated SEQ ID:1700, and is provided hereinbelow with ref–

erence to the sequence listing part. Nucleotide sequence SEQ ID:1700 is located at position 9679 relative to the genome of Sindbis Virus.

- [57787] VGAM1714 precursor RNA folds onto itself, forming VGAM1714 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [57788] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1714 folded precursor RNA into VGAM1714 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1714 RNA is designated SEQ ID:4425, and is provided hereinbelow with reference to the sequence listing part.

[57789] VGAM1714 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1714 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1714 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[57790] VGAM1714 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1714 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1714 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1714 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM1714 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[57791] The complementary binding of VGAM1714 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1714 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1714 host target RNA into VGAM1714 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[57792] It is appreciated that VGAM1714 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1714 host target genes. The mRNA of each one of this plurality of VGAM1714 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1714 RNA, herein designated VGAM RNA, and which when bound by VGAM1714 RNA causes

inhibition of translation of respective one or more VGAM1714 host target proteins.

[57793] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1714 gene, herein designated VGAM GENE, on one or more VGAM1714 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[57794] It is yet further appreciated that a function of VGAM1714 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1714 include diagnosis, prevention and

treatment of viral infection by Sindbis Virus. Specific functions, and accordingly utilities, of VGAM1714 correlate with, and may be deduced from, the identity of the host target genes which VGAM1714 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[57795] Nucleotide sequences of the VGAM1714 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1714 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1714 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1714 are further described hereinbelow with reference to Table 1.

[57796] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1714 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1714 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[57797] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1714 gene, herein designated VGAM is inhibition of expression of VGAM1714 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM1714 correlate with, and may be deduced from, the identity of the target genes which VGAM1714 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[57798] Gamma-glutamyltransferase 2 (GGT2, Accession XM\_057166) is a VGAM1714 host target gene. GGT2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GGT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GGT2 BINDING SITE, designated SEQ ID:36486, to the nucleotide sequence of VGAM1714 RNA, herein designated VGAM RNA, also designated SEQ ID:4425.

[57799] A function of VGAM1714 is therefore inhibition of Gamma-glutamyltransferase 2 (GGT2, Accession XM\_057166). Accordingly, utilities of VGAM1714 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GGT2. Gap Junction Protein, Beta 3, 31kDa (connexin 31) (GJB3, Accession NM\_024009) is another VGAM1714 host target gene. GJB3 BINDING SITE is HOST TARGET binding site found in the

3' untranslated region of mRNA encoded by GJB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GJB3 BINDING SITE, designated SEQ ID:23436, to the nucleotide sequence of VGAM1714 RNA, herein designated VGAM RNA, also designated SEQ ID:4425.

[57800] Another function of VGAM1714 is therefore inhibition of Gap Junction Protein, Beta 3, 31kDa (connexin 31) (GJB3, Accession NM\_024009). Accordingly, utilities of VGAM1714 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GJB3. Potassium Channel, Subfamily T, Member 1 (KCNT1, Accession XM\_029962) is another VGAM1714 host target gene. KCNT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KCNT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNT1 BINDING SITE, designated SEQ ID:30971, to the nucleotide sequence of VGAM1714 RNA, herein designated VGAM RNA, also designated SEQ ID:4425.

[57801] Another function of VGAM1714 is therefore inhibition of Potassium Channel, Subfamily T, Member 1 (KCNT1, Accession XM\_029962). Accordingly, utilities of VGAM1714 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNT1. KIAA0125 (Accession NM\_014792) is another VGAM1714 host target gene. KIAA0125 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0125, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0125 BINDING SITE, designated SEQ ID:16688, to the nucleotide sequence of VGAM1714 RNA, herein designated VGAM RNA, also designated SEQ ID:4425.

[57802] Another function of VGAM1714 is therefore inhibition of KIAA0125 (Accession NM\_014792). Accordingly, utilities of VGAM1714 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0125. KIAA0628 (Accession NM\_014789) is another VGAM1714 host target gene. KIAA0628 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0628, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0628 BINDING SITE, designated SEQ ID:16672, to the nucleotide sequence of VGAM1714 RNA, herein designated VGAM RNA, also designated SEQ ID:4425.

[57803] Another function of VGAM1714 is therefore inhibition of KIAA0628 (Accession NM\_014789). Accordingly, utilities of VGAM1714 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0628. SH3 Domain Binding Glutamic Acid-rich Protein Like (SH3BGRL, Accession XM\_030373) is another VGAM1714 host target gene. SH3BGRL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SH3BGRL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SH3BGRL BINDING SITE, designated SEQ ID:31026, to the nucleotide sequence of VGAM1714 RNA, herein designated VGAM RNA, also designated SEQ ID:4425.

[57804] Another function of VGAM1714 is therefore inhibition of SH3 Domain Binding Glutamic Acid-rich Protein Like

(SH3BGRL, Accession XM\_030373). Accordingly, utilities of VGAM1714 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SH3BGRL. LOC124602 (Accession XM\_058829) is another VGAM1714 host target gene. LOC124602 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC124602, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124602 BINDING SITE, designated SEQ ID:36757, to the nucleotide sequence of VGAM1714 RNA, herein designated VGAM RNA, also designated SEQ ID:4425.

[57805] Another function of VGAM1714 is therefore inhibition of LOC124602 (Accession XM\_058829). Accordingly, utilities of VGAM1714 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124602. LOC149319 (Accession XM\_086495) is another VGAM1714 host target gene. LOC149319 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149319, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC149319 BINDING SITE, designated SEQ ID:38711, to the nucleotide sequence of VGAM1714 RNA, herein designated VGAM RNA, also designated SEQ ID:4425.

[57806] Another function of VGAM1714 is therefore inhibition of LOC149319 (Accession XM\_086495). Accordingly, utilities of VGAM1714 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149319. LOC203397 (Accession XM\_114695) is another VGAM1714 host target gene. LOC203397 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203397, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203397 BINDING SITE, designated SEQ ID:43037, to the nucleotide sequence of VGAM1714 RNA, herein designated VGAM RNA, also designated SEQ ID:4425.

[57807] Another function of VGAM1714 is therefore inhibition of LOC203397 (Accession XM\_114695). Accordingly, utilities of VGAM1714 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203397. LOC254100 (Accession XM\_172851) is an-

other VGAM1714 host target gene. LOC254100 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254100, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254100 BINDING SITE, designated SEQ ID:46126, to the nucleotide sequence of VGAM1714 RNA, herein designated VGAM RNA, also designated SEQ ID:4425.

[57808] Another function of VGAM1714 is therefore inhibition of LOC254100 (Accession XM\_172851). Accordingly, utilities of VGAM1714 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254100. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1715 (VGAM1715) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[57809] VGAM1715 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1715 was detected is de-

scribed hereinabove with reference to Figs. 1–8.

[57810] VGAM1715 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sindbis Virus.

VGAM1715 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[57811] VGAM1715 gene encodes a VGAM1715 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1715 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1715 precursor RNA is designated SEQ ID:1701, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1701 is located at position 10643 relative to the genome of Sindbis Virus.

[57812] VGAM1715 precursor RNA folds onto itself, forming VGAM1715 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[57813] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1715 folded precursor RNA into VGAM1715 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM1715 RNA is designated SEQ ID:4426, and is provided hereinbelow with reference to the sequence listing part.

[57814] VGAM1715 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1715 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1715 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[57815] VGAM1715 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1715 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1715 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1715 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1715 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[57816] The complementary binding of VGAM1715 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1715 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1715 host target RNA into VGAM1715 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[57817] It is appreciated that VGAM1715 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1715 host target genes. The mRNA of each one of this plurality of VGAM1715 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1715 RNA, herein designated VGAM RNA, and which when bound by VGAM1715 RNA causes inhibition of translation of respective one or more VGAM1715 host target proteins.

[57818] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1715 gene, herein designated VGAM GENE, on one or more VGAM1715 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[57819] It is yet further appreciated that a function of VGAM1715 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1715 include diagnosis, prevention and treatment of viral infection by Sindbis Virus. Specific functions, and accordingly utilities, of VGAM1715 correlate with, and may be deduced from, the identity of the host target genes which VGAM1715 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[57820] Nucleotide sequences of the VGAM1715 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1715 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM1715 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1715 are further described hereinbelow with reference to Table 1.

[57821] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1715 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1715 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[57822] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1715 gene, herein designated VGAM is inhibition of expression of VGAM1715 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1715 correlate with, and may be deduced from, the identity of the target genes which VGAM1715 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[57823] Microtubule-associated Protein 1A (MAP1A, Accession NM\_002373) is a VGAM1715 host target gene. MAP1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAP1A, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP1A BINDING SITE, designated SEQ ID:8183, to the nucleotide sequence of VGAM1715 RNA, herein designated VGAM RNA, also designated SEQ ID:4426.

[57824] A function of VGAM1715 is therefore inhibition of Microtubule-associated Protein 1A (MAP1A, Accession NM\_002373), a gene which is a structural protein involved in the filamentous cross-bridging between microtubules and other skeletal elements. Accordingly, utilities of VGAM1715 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP1A. The function of MAP1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM315. SORCS2 (Accession NM\_020777) is another VGAM1715 host target gene. SORCS2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SORCS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SORCS2 BINDING SITE, designated SEQ ID:21876, to the nucleotide

sequence of VGAM1715 RNA, herein designated VGAM RNA, also designated SEQ ID:4426.

[57825] Another function of VGAM1715 is therefore inhibition of SORCS2 (Accession NM\_020777). Accordingly, utilities of VGAM1715 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SORCS2. DEPC-1 (Accession NM\_139178) is another VGAM1715 host target gene. DEPC-1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DEPC-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DEPC-1 BINDING SITE, designated SEQ ID:29191, to the nucleotide sequence of VGAM1715 RNA, herein designated VGAM RNA, also designated SEQ ID:4426.

[57826] Another function of VGAM1715 is therefore inhibition of DEPC-1 (Accession NM\_139178). Accordingly, utilities of VGAM1715 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DEPC-1. FLJ12891 (Accession NM\_024950) is another VGAM1715 host target gene. FLJ12891 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by FLJ12891, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12891 BINDING SITE, designated SEQ ID:24509, to the nucleotide sequence of VGAM1715 RNA, herein designated VGAM RNA, also designated SEQ ID:4426.

[57827] Another function of VGAM1715 is therefore inhibition of FLJ12891 (Accession NM\_024950). Accordingly, utilities of VGAM1715 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12891. FLJ21977 (Accession NM\_032213) is another VGAM1715 host target gene. FLJ21977 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21977, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21977 BINDING SITE, designated SEQ ID:25939, to the nucleotide sequence of VGAM1715 RNA, herein designated VGAM RNA, also designated SEQ ID:4426.

[57828] Another function of VGAM1715 is therefore inhibition of FLJ21977 (Accession NM\_032213). Accordingly, utilities of

VGAM1715 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21977. Protein Phosphatase 2 (formerly 2A), Regulatory Subunit B", Alpha (PPP2R3A, Accession NM\_002718) is another VGAM1715 host target gene. PPP2R3A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP2R3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP2R3A BINDING SITE, designated SEQ ID:8585, to the nucleotide sequence of VGAM1715 RNA, herein designated VGAM RNA, also designated SEQ ID:4426.

[57829] Another function of VGAM1715 is therefore inhibition of Protein Phosphatase 2 (formerly 2A), Regulatory Subunit B", Alpha (PPP2R3A, Accession NM\_002718). Accordingly, utilities of VGAM1715 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP2R3A. LOC146108 (Accession XM\_085322) is another VGAM1715 host target gene. LOC146108 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146108, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146108 BINDING SITE, designated SEQ ID:38062, to the nucleotide sequence of VGAM1715 RNA, herein designated VGAM RNA, also designated SEQ ID:4426.

[57830] Another function of VGAM1715 is therefore inhibition of LOC146108 (Accession XM\_085322). Accordingly, utilities of VGAM1715 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146108. LOC219529 (Accession XM\_167563) is another VGAM1715 host target gene. LOC219529 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219529, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219529 BINDING SITE, designated SEQ ID:44671, to the nucleotide sequence of VGAM1715 RNA, herein designated VGAM RNA, also designated SEQ ID:4426.

[57831] Another function of VGAM1715 is therefore inhibition of LOC219529 (Accession XM\_167563). Accordingly, utilities of VGAM1715 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC219529. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1716 (VGAM1716) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[57832] VGAM1716 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1716 was detected is described hereinabove with reference to Figs. 1–8.

[57833] VGAM1716 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sindbis Virus. VGAM1716 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[57834] VGAM1716 gene encodes a VGAM1716 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1716 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1716 precursor RNA is designated SEQ ID:1702, and is provided hereinbelow with ref–

erence to the sequence listing part. Nucleotide sequence SEQ ID:1702 is located at position 8996 relative to the genome of Sindbis Virus.

- [57835] VGAM1716 precursor RNA folds onto itself, forming VGAM1716 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [57836] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1716 folded precursor RNA into VGAM1716 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide sequence of VGAM1716 RNA is designated SEQ ID:4427, and is provided hereinbelow with reference to the sequence listing part.

[57837] VGAM1716 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1716 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1716 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[57838] VGAM1716 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1716 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1716 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1716 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM1716 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[57839] The complementary binding of VGAM1716 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1716 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1716 host target RNA into VGAM1716 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[57840] It is appreciated that VGAM1716 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1716 host target genes. The mRNA of each one of this plurality of VGAM1716 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1716 RNA, herein designated VGAM RNA, and which when bound by VGAM1716 RNA causes

inhibition of translation of respective one or more VGAM1716 host target proteins.

[57841] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1716 gene, herein designated VGAM GENE, on one or more VGAM1716 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[57842] It is yet further appreciated that a function of VGAM1716 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1716 include diagnosis, prevention and

treatment of viral infection by Sindbis Virus. Specific functions, and accordingly utilities, of VGAM1716 correlate with, and may be deduced from, the identity of the host target genes which VGAM1716 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[57843] Nucleotide sequences of the VGAM1716 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1716 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1716 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1716 are further described hereinbelow with reference to Table 1.

[57844] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1716 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1716 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[57845] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1716 gene, herein designated VGAM is inhibition of expression of VGAM1716 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM1716 correlate with, and may be deduced from, the identity of the target genes which VGAM1716 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[57846] Membrane Cofactor Protein (CD46, trophoblast-lymphocyte cross-reactive antigen) (MCP, Accession NM\_002389) is a VGAM1716 host target gene. MCP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MCP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MCP BINDING SITE, designated SEQ ID:8205, to the nucleotide sequence of VGAM1716 RNA, herein designated VGAM RNA, also designated SEQ ID:4427.

[57847] A function of VGAM1716 is therefore inhibition of Membrane Cofactor Protein (CD46, trophoblast-lymphocyte cross-reactive antigen) (MCP, Accession NM\_002389), a gene which may be involved in the regulation of complement activation. Accordingly, utilities of VGAM1716 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MCP. The function of

MCP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM383.DKFZP564C196 (Accession XM\_046405) is another VGAM1716 host target gene. DKFZP564C196 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP564C196, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564C196 BINDING SITE, designated SEQ ID:34715, to the nucleotide sequence of VGAM1716 RNA, herein designated VGAM RNA, also designated SEQ ID:4427.

[57848] Another function of VGAM1716 is therefore inhibition of DKFZP564C196 (Accession XM\_046405). Accordingly, utilities of VGAM1716 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564C196. FLJ20984 (Accession NM\_024630) is another VGAM1716 host target gene. FLJ20984 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ20984, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20984 BINDING SITE, designated SEQ ID:23895, to the nucleotide sequence of VGAM1716 RNA, herein designated VGAM RNA, also designated SEQ ID:4427.

[57849] Another function of VGAM1716 is therefore inhibition of FLJ20984 (Accession NM\_024630). Accordingly, utilities of VGAM1716 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20984. Zinc Finger Protein 95 Homolog (mouse) (ZFP95, Accession NM\_014569) is another VGAM1716 host target gene. ZFP95 BINDING SITE1 and ZFP95 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ZFP95, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZFP95 BINDING SITE1 and ZFP95 BINDING SITE2, designated SEQ ID:15918 and SEQ ID:29708 respectively, to the nucleotide sequence of VGAM1716 RNA, herein designated VGAM RNA, also designated SEQ ID:4427.

[57850] Another function of VGAM1716 is therefore inhibition of Zinc Finger Protein 95 Homolog (mouse) (ZFP95, Acces-

sion NM\_014569). Accordingly, utilities of VGAM1716 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFP95. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1717 (VGAM1717) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[57851] VGAM1717 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1717 was detected is described hereinabove with reference to Figs. 1-8.

[57852] VGAM1717 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Molluscum Contagiosum Virus. VGAM1717 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[57853] VGAM1717 gene encodes a VGAM1717 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1717 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM1717 precursor RNA is designated SEQ ID:1703, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1703 is located at position 67026 relative to the genome of Molluscum Contagiosum Virus.

- [57854] VGAM1717 precursor RNA folds onto itself, forming VGAM1717 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [57855] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1717 folded precursor RNA into VGAM1717 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1717 RNA is designated SEQ ID:4428, and

is provided hereinbelow with reference to the sequence listing part.

[57856] VGAM1717 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1717 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1717 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[57857] VGAM1717 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1717 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1717 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM1717 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1717 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[57858] The complementary binding of VGAM1717 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1717 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1717 host target RNA into VGAM1717 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[57859] It is appreciated that VGAM1717 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1717 host target genes. The mRNA of each one of this plurality of VGAM1717 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com–

plementary to VGAM1717 RNA, herein designated VGAM RNA, and which when bound by VGAM1717 RNA causes inhibition of translation of respective one or more VGAM1717 host target proteins.

[57860] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1717 gene, herein designated VGAM GENE, on one or more VGAM1717 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[57861] It is yet further appreciated that a function of VGAM1717 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1717 include diagnosis, prevention and treatment of viral infection by Mollusum Contagiosum Virus. Specific functions, and accordingly utilities, of VGAM1717 correlate with, and may be deduced from, the identity of the host target genes which VGAM1717 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[57862] Nucleotide sequences of the VGAM1717 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1717 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1717 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1717 are further described hereinbelow with reference to Table 1.

[57863] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1717 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1717 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[57864] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM1717 gene, herein designated VGAM is inhibition of expression of VGAM1717 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1717 correlate with, and may be deduced from, the identity of the target genes which VGAM1717 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[57865] Adenosine Deaminase, RNA-specific, B1 (RED1 homolog rat) (ADARB1, Accession NM\_001112) is a VGAM1717 host target gene. ADARB1 BINDING SITE1 and ADARB1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ADARB1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADARB1 BINDING SITE1 and ADARB1 BINDING SITE2, designated SEQ ID:6777 and SEQ ID:17948 respectively, to the nucleotide sequence of VGAM1717 RNA, herein designated VGAM RNA, also designated SEQ ID:4428.

[57866] A function of VGAM1717 is therefore inhibition of Adenosine Deaminase, RNA-specific, B1 (RED1 homolog rat) (ADARB1, Accession NM\_001112), a gene which RNA editing involves the deamination of adenosines at specific

sites. Accordingly, utilities of VGAM1717 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADARB1. The function of ADARB1 has been established by previous studies. RNA editing involves the deamination of adenosines at specific sites, the result of which can be a change in the amino acid sequence of the protein so that it differs from that predicted by the sequence of the DNA. Editing of the glutamate receptor B (GluRB; 138247) pre-mRNA has been shown to alter a codon (referred to as the Q/R site) for a channel determinant that controls the calcium permeability of the AMPA glutamate receptors. Melcher et al. (1996) tested the candidate dsRNA adenosine deaminase DRADA (OMIM Ref. No. 601059) and showed that when coexpressed with a GluR-B minigene in HEK 293 cells, DRADA produced low-level editing at the GluR-B Q/R site. The authors then screened a rat brain cDNA library with the predicted catalytic domain of rat DRADA to identify other potential editing enzymes. A cDNA encoding a predicted 711-amino acid protein was isolated that gave about 90% of the expected activity in their editing assay. Melcher et al. (1996) designated this novel mammalian RNA editing protein RNA-editing enzyme-1 (RED1). Rat RED1 and

DRADA share about 31% overall identity primarily due to their conservation in the C-terminal catalytic domain. Northern blots showed highest expression of RED1 in rat brain. Melcher et al. (1996) further observed that while RED1 was more efficient at deaminating some sites, DRADA had stronger activity at others. They speculated that a combination of these and perhaps other editing enzymes may be involved in determining the overall editing process for a given transcript. Higuchi et al. (2000) studied ADAR2-mediated RNA editing by generating mice that were homozygous for a targeted functional null allele. Editing in *Adar2*  $-/-$  mice was substantially reduced at most of 25 positions in diverse transcripts; the mutant mice became prone to seizures and died young. The impaired phenotype appeared to result entirely from a single underedited position, since it reverted to normal when both alleles for the underedited transcript were substituted with alleles encoding the edited version exonically. The critical position specifies an ion channel determinant, the Q/R site, in AMPA receptor GluRB premessenger RNA. Higuchi et al. (2000) concluded that this transcript is physiologically the most important substrate of ADAR2.

[57867] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [57868] Melcher, T.; Maas, S.; Herb, A.; Sprengel, R.; Seeburg, P. H.; Higuchi, M. : A mammalian RNA editing enzyme. Nature 379: 460–463, 1996. ; and
- [57869] Higuchi, M.; Maas, S.; Single, F. N.; Hartner, J.; Rozov, A.; Burnashev, N.; Feldmeyer, D.; Sprengel, R.; Seeburg, P. H. : Point mutation in an AMPA receptor gene rescues lethality in mi.
- [57870] Further studies establishing the function and utilities of ADARB1 are found in John Hopkins OMIM database record ID 601218, and in cited publications numbered 7167–7173 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FLJ14566 (Accession NM\_032806) is another VGAM1717 host target gene. FLJ14566 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ14566, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14566 BINDING SITE, designated SEQ ID:26564, to the nucleotide sequence of VGAM1717 RNA, herein designated VGAM RNA, also designated SEQ

ID:4428.

[57871] Another function of VGAM1717 is therefore inhibition of FLJ14566 (Accession NM\_032806). Accordingly, utilities of VGAM1717 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14566. KIAA1644 (Accession XM\_097892) is another VGAM1717 host target gene. KIAA1644 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1644, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1644 BINDING SITE, designated SEQ ID:41200, to the nucleotide sequence of VGAM1717 RNA, herein designated VGAM RNA, also designated SEQ ID:4428.

[57872] Another function of VGAM1717 is therefore inhibition of KIAA1644 (Accession XM\_097892). Accordingly, utilities of VGAM1717 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1644. RoXaN (Accession NM\_025013) is another VGAM1717 host target gene. RoXaN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RoXaN, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RoXaN BINDING SITE, designated SEQ ID:24600, to the nucleotide sequence of VGAM1717 RNA, herein designated VGAM RNA, also designated SEQ ID:4428.

[57873] Another function of VGAM1717 is therefore inhibition of RoXaN (Accession NM\_025013). Accordingly, utilities of VGAM1717 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RoXaN. LOC128989 (Accession XM\_059310) is another VGAM1717 host target gene. LOC128989 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC128989, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC128989 BINDING SITE, designated SEQ ID:36939, to the nucleotide sequence of VGAM1717 RNA, herein designated VGAM RNA, also designated SEQ ID:4428.

[57874] Another function of VGAM1717 is therefore inhibition of LOC128989 (Accession XM\_059310). Accordingly, utilities of VGAM1717 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC128989. LOC147054 (Accession XM\_097172) is another VGAM1717 host target gene. LOC147054 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC147054, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147054 BINDING SITE, designated SEQ ID:40788, to the nucleotide sequence of VGAM1717 RNA, herein designated VGAM RNA, also designated SEQ ID:4428.

[57875] Another function of VGAM1717 is therefore inhibition of LOC147054 (Accession XM\_097172). Accordingly, utilities of VGAM1717 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147054. LOC149103 (Accession XM\_086434) is another VGAM1717 host target gene. LOC149103 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149103, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149103 BINDING SITE, designated SEQ ID:38651, to

the nucleotide sequence of VGAM1717 RNA, herein designated VGAM RNA, also designated SEQ ID:4428.

[57876] Another function of VGAM1717 is therefore inhibition of LOC149103 (Accession XM\_086434). Accordingly, utilities of VGAM1717 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149103. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1718 (VGAM1718) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[57877] VGAM1718 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1718 was detected is described hereinabove with reference to Figs. 1–8.

[57878] VGAM1718 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Molluscum Contagiosum Virus. VGAM1718 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[57879] VGAM1718 gene encodes a VGAM1718 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1718 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1718 precursor RNA is designated SEQ ID:1704, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1704 is located at position 64920 relative to the genome of Molluscum Contagiosum Virus.

[57880] VGAM1718 precursor RNA folds onto itself, forming VGAM1718 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[57881] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1718 folded precursor RNA into VGAM1718 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM1718 RNA is designated SEQ ID:4429, and is provided hereinbelow with reference to the sequence listing part.

[57882] VGAM1718 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1718 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1718 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[57883] VGAM1718 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1718 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1718 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1718 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1718 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[57884] The complementary binding of VGAM1718 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1718 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1718 host target RNA into VGAM1718 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[57885] It is appreciated that VGAM1718 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1718 host target genes. The mRNA of each one of this plurality of VGAM1718 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1718 RNA, herein designated VGAM RNA, and which when bound by VGAM1718 RNA causes inhibition of translation of respective one or more VGAM1718 host target proteins.

[57886] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1718 gene, herein designated VGAM GENE, on one or more VGAM1718 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[57887] It is yet further appreciated that a function of VGAM1718 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1718 include diagnosis, prevention and treatment of viral infection by Mollusum Contagiosum Virus. Specific functions, and accordingly utilities, of VGAM1718 correlate with, and may be deduced from, the identity of the host target genes which VGAM1718 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[57888] Nucleotide sequences of the VGAM1718 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1718 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1718 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1718 are further described hereinbelow with reference to Table 1.

[57889] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1718 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM1718 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[57890] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1718 gene, herein designated VGAM is inhibition of expression of VGAM1718 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1718 correlate with, and may be deduced from, the identity of the target genes which VGAM1718 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[57891] Aquaporin 1 (channel-forming integral protein, 28kDa) (AQP1, Accession NM\_000385) is a VGAM1718 host target gene. AQP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AQP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AQP1 BINDING SITE, designated SEQ ID:5958, to the nucleotide sequence of VGAM1718 RNA, herein designated VGAM RNA, also designated SEQ ID:4429.

[57892] A function of VGAM1718 is therefore inhibition of Aquaporin 1 (channel-forming integral protein, 28kDa) (AQP1,

Accession NM\_000385). Accordingly, utilities of VGAM1718 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AQP1. ATPase, Aminophospholipid Transporter-like, Class I, Type 8A, Member 2 (ATP8A2, Accession XM\_167916) is another VGAM1718 host target gene. ATP8A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP8A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP8A2 BINDING SITE, designated SEQ ID:44919, to the nucleotide sequence of VGAM1718 RNA, herein designated VGAM RNA, also designated SEQ ID:4429.

[57893] Another function of VGAM1718 is therefore inhibition of ATPase, Aminophospholipid Transporter-like, Class I, Type 8A, Member 2 (ATP8A2, Accession XM\_167916). Accordingly, utilities of VGAM1718 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP8A2. Delta-like 1 Homolog (Drosophila) (DLK1, Accession NM\_003836) is another VGAM1718 host target gene. DLK1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region

of mRNA encoded by DLK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DLK1 BINDING SITE, designated SEQ ID:9928, to the nucleotide sequence of VGAM1718 RNA, herein designated VGAM RNA, also designated SEQ ID:4429.

[57894] Another function of VGAM1718 is therefore inhibition of Delta-like 1 Homolog (Drosophila) (DLK1, Accession NM\_003836), a gene which may have a role in neuroendocrine differentiation. Accordingly, utilities of VGAM1718 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DLK1. The function of DLK1 has been established by previous studies. Lee et al. (1995) reported that DLK, pG2, and PREF1 are variant products of the same gene. They noted that C. Smas and H.S. Sul acknowledged in a personal communication that the major point of divergence between mouse Dlk and Pref1 was due to sequence data misinterpretation. Sequence analysis of multiple human DLK cDNAs revealed that there are several variant forms of DLK mRNA. Dlk1 and Gtl2 (OMIM Ref. No. 605636) are reciprocally imprinted genes located 80 kb apart on mouse chromosome

12. There are similarities between this domain and that of the well-characterized Igf2/H19 locus (see OMIM Ref. No. 103280) (Wylie et al., 2000). Takada et al. (2002) described a detailed methylation analysis of the Dlk1/Gtl2 domain on both parental alleles in the mouse. Like the Igf2/H19 domain, areas of differential methylation are hypermethylated on the paternal allele and hypomethylated on the maternal allele. Three differentially methylated regions (DMRs), each with different epigenetic characteristics, were identified. One DMR is intergenic, contains tandem repeats, and is the only region that inherits a paternal methylation mark from the germline. An intronic DMR contains a conserved putative CTCF (OMIM Ref. No. 604167)-binding domain. All 3 DMRs have both unique and common features compared to those identified in the Igf2/H19 domain.

[57895] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[57896] Jensen, C. H.; Krogh, T. N.; Hojrup, P.; Clausen, P. P.; Skjodt, K.; Larsson, L.-I.; Enghild, J. J.; Teisner, B. : Protein structure of fetal antigen 1 (FA1): a novel circulating human epidermal-growth-factor-like protein expressed in

neuroendocrine tumors and its relation to the gene products of dlk and pG2. *Europ. J. Biochem.* 225: 83–92, 1994.  
; and

[57897] Takada, S.; Paulsen, M.; Tevendale, M.; Tsai, C.–E.; Kelsey, G.; Cattanach, B. M.; Ferguson–Smith, A. C. : Epigenetic analysis of the Dlk1–Gtl2 imprinted domain on mouse chromosome 12: i.

[57898] Further studies establishing the function and utilities of DLK1 are found in John Hopkins OMIM database record ID 176290, and in cited publications numbered 49–50, 54, 70 and 5459–5462 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Huntingtin (Huntington disease) (HD, Accession NM\_002111) is another VGAM1718 host target gene. HD BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HD BINDING SITE, designated SEQ ID:7892, to the nucleotide sequence of VGAM1718 RNA, herein designated VGAM RNA, also designated SEQ ID:4429.

[57899] Another function of VGAM1718 is therefore inhibition of

Huntingtin (Huntington disease) (HD, Accession NM\_002111). Accordingly, utilities of VGAM1718 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HD. Interleukin 12 Receptor, Beta 2 (IL12RB2, Accession NM\_001559) is another VGAM1718 host target gene. IL12RB2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL12RB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL12RB2 BINDING SITE, designated SEQ ID:7278, to the nucleotide sequence of VGAM1718 RNA, herein designated VGAM RNA, also designated SEQ ID:4429.

[57900] Another function of VGAM1718 is therefore inhibition of Interleukin 12 Receptor, Beta 2 (IL12RB2, Accession NM\_001559), a gene which is involved in il-12 transduction. binds to il-12 with a low affinity. Accordingly, utilities of VGAM1718 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL12RB2. The function of IL12RB2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove

with reference to VGAM326.Jagged 2 (JAG2, Accession NM\_002226) is another VGAM1718 host target gene. JAG2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by JAG2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JAG2 BINDING SITE, designated SEQ ID:8004, to the nucleotide sequence of VGAM1718 RNA, herein designated VGAM RNA, also designated SEQ ID:4429.

[57901] Another function of VGAM1718 is therefore inhibition of Jagged 2 (JAG2, Accession NM\_002226), a gene which is a putative notch ligand involved in the mediation of notch signaling. Accordingly, utilities of VGAM1718 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JAG2. The function of JAG2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM136.Msh Homeo Box Homolog 1 (Drosophila) (MSX1, Accession NM\_002448) is another VGAM1718 host target gene. MSX1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MSX1,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MSX1 BINDING SITE, designated SEQ ID:8286, to the nucleotide sequence of VGAM1718 RNA, herein designated VGAM RNA, also designated SEQ ID:4429.

[57902] Another function of VGAM1718 is therefore inhibition of Msh Homeo Box Homolog 1 (Drosophila) (MSX1, Accession NM\_002448). Accordingly, utilities of VGAM1718 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MSX1. Metastasis-associated 1-like 1 (MTA1L1, Accession NM\_004739) is another VGAM1718 host target gene. MTA1L1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MTA1L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MTA1L1 BINDING SITE, designated SEQ ID:11135, to the nucleotide sequence of VGAM1718 RNA, herein designated VGAM RNA, also designated SEQ ID:4429.

[57903] Another function of VGAM1718 is therefore inhibition of Metastasis-associated 1-like 1 (MTA1L1, Accession

NM\_004739), a gene which regulates histone deacetylase core complex enzymatic activity. Accordingly, utilities of VGAM1718 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTA1L1. The function of MTA1L1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM659. Myotubularin Related Protein 3 (MTMR3, Accession NM\_021090) is another VGAM1718 host target gene. MTMR3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MTMR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MTMR3 BINDING SITE, designated SEQ ID:22073, to the nucleotide sequence of VGAM1718 RNA, herein designated VGAM RNA, also designated SEQ ID:4429.

[57904] Another function of VGAM1718 is therefore inhibition of Myotubularin Related Protein 3 (MTMR3, Accession NM\_021090), a gene which could be a tyrosine-phosphatase. Accordingly, utilities of VGAM1718 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with MTMR3. The function of MTMR3 has been established by previous studies. Zhao et al. (2001) showed that an isoform of MTMR3, missing exon 17, dephosphorylates para-nitrophenylphosphate and phosphatidylinositol 3-phosphate.

[57905] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[57906] Nagase, T.; Ishikawa, K.; Nakajima, D.; Ohira, M.; Seki, N.; Miyajima, N.; Tanaka, A.; Kotani, H.; Nomura, N.; Ohara, O. : Prediction of the coding sequences of unidentified human genes. VII. The complete sequences of 100 new cDNA clones from brain which can code for large proteins in vitro. DNA Res. 4: 141-150, 1997. ; and

[57907] Zhao, R.; Qi, Y.; Chen, J.; Zhao, Z. J. : FYVE-DSP2, a FYVE domain-containing dual specificity protein phosphatase that dephosphorylates phosphotidylinositol (sic) 3-phosphate. Exp. Cel.

[57908] Further studies establishing the function and utilities of MTMR3 are found in John Hopkins OMIM database record ID 603558, and in cited publications numbered 725 and 5003 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Protein Phos-

phatase 2 (formerly 2A), Regulatory Subunit B (PR 52), Gamma Isoform (PPP2R2C, Accession XM\_029744) is another VGAM1718 host target gene. PPP2R2C BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PPP2R2C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP2R2C BINDING SITE, designated SEQ ID:30939, to the nucleotide sequence of VGAM1718 RNA, herein designated VGAM RNA, also designated SEQ ID:4429.

[57909] Another function of VGAM1718 is therefore inhibition of Protein Phosphatase 2 (formerly 2A), Regulatory Subunit B (PR 52), Gamma Isoform (PPP2R2C, Accession XM\_029744). Accordingly, utilities of VGAM1718 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP2R2C. Solute Carrier Family 19 (folate transporter), Member 1 (SLC19A1, Accession NM\_003056) is another VGAM1718 host target gene. SLC19A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC19A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of SLC19A1 BINDING SITE, designated SEQ ID:9020, to the nucleotide sequence of VGAM1718 RNA, herein designated VGAM RNA, also designated SEQ ID:4429.

[57910] Another function of VGAM1718 is therefore inhibition of Solute Carrier Family 19 (folate transporter), Member 1 (SLC19A1, Accession NM\_003056). Accordingly, utilities of VGAM1718 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC19A1. Tripartite Motif-containing 9 (TRIM9, Accession NM\_015163) is another VGAM1718 host target gene. TRIM9 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TRIM9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM9 BINDING SITE, designated SEQ ID:17518, to the nucleotide sequence of VGAM1718 RNA, herein designated VGAM RNA, also designated SEQ ID:4429.

[57911] Another function of VGAM1718 is therefore inhibition of Tripartite Motif-containing 9 (TRIM9, Accession

NM\_015163), a gene which may function as a positive regulator for mannosylphosphate transferase and is required to mediate mannosylphosphate transfer in both the core and outer chain portions of n-linked oligosaccharides. Accordingly, utilities of VGAM1718 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM9. The function of TRIM9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74. Transient Receptor Potential Cation Channel, Subfamily V, Member 2 (TRPV2, Accession NM\_016113) is another VGAM1718 host target gene. TRPV2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TRPV2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPV2 BINDING SITE, designated SEQ ID:18195, to the nucleotide sequence of VGAM1718 RNA, herein designated VGAM RNA, also designated SEQ ID:4429.

[57912] Another function of VGAM1718 is therefore inhibition of Transient Receptor Potential Cation Channel, Subfamily V,

Member 2 (TRPV2, Accession NM\_016113). Accordingly, utilities of VGAM1718 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPV2. Ubiquitin Specific Protease 6 (Tre-2 oncogene) (USP6, Accession XM\_165948) is another VGAM1718 host target gene. USP6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by USP6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of USP6 BINDING SITE, designated SEQ ID:43807, to the nucleotide sequence of VGAM1718 RNA, herein designated VGAM RNA, also designated SEQ ID:4429.

[57913] Another function of VGAM1718 is therefore inhibition of Ubiquitin Specific Protease 6 (Tre-2 oncogene) (USP6, Accession XM\_165948), a gene which has an atp-independent isopeptidase activity, cleaving at the carboxyl terminus of the ubiquitin moiety. Accordingly, utilities of VGAM1718 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USP6. The function of USP6 and its association with various diseases and clinical conditions, has been established by

previous studies, as described hereinabove with reference to VGAM296.C1q and Tumor Necrosis Factor Related Protein 7 (C1QTNF7, Accession NM\_031911) is another VGAM1718 host target gene. C1QTNF7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C1QTNF7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1QTNF7 BINDING SITE, designated SEQ ID:25662, to the nucleotide sequence of VGAM1718 RNA, herein designated VGAM RNA, also designated SEQ ID:4429.

[57914] Another function of VGAM1718 is therefore inhibition of C1q and Tumor Necrosis Factor Related Protein 7 (C1QTNF7, Accession NM\_031911). Accordingly, utilities of VGAM1718 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1QTNF7. Chromobox Homolog 6 (CBX6, Accession NM\_014292) is another VGAM1718 host target gene. CBX6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CBX6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of CBX6 BINDING SITE, designated SEQ ID:15572, to the nucleotide sequence of VGAM1718 RNA, herein designated VGAM RNA, also designated SEQ ID:4429.

[57915] Another function of VGAM1718 is therefore inhibition of Chromobox Homolog 6 (CBX6, Accession NM\_014292). Accordingly, utilities of VGAM1718 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBX6. DKFZP434O047 (Accession NM\_015594) is another VGAM1718 host target gene. DKFZP434O047 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZP434O047, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434O047 BINDING SITE, designated SEQ ID:17860, to the nucleotide sequence of VGAM1718 RNA, herein designated VGAM RNA, also designated SEQ ID:4429.

[57916] Another function of VGAM1718 is therefore inhibition of DKFZP434O047 (Accession NM\_015594). Accordingly, utilities of VGAM1718 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with DKFZP434O047. DR1-associated Protein 1 (negative cofactor 2 alpha) (DRAP1, Accession NM\_006442) is another VGAM1718 host target gene. DRAP1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DRAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DRAP1 BINDING SITE, designated SEQ ID:13154, to the nucleotide sequence of VGAM1718 RNA, herein designated VGAM RNA, also designated SEQ ID:4429.

[57917] Another function of VGAM1718 is therefore inhibition of DR1-associated Protein 1 (negative cofactor 2 alpha) (DRAP1, Accession NM\_006442). Accordingly, utilities of VGAM1718 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DRAP1. FLJ00001 (Accession XM\_088525) is another VGAM1718 host target gene. FLJ00001 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ00001, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ00001 BINDING SITE,

designated SEQ ID:39779, to the nucleotide sequence of VGAM1718 RNA, herein designated VGAM RNA, also designated SEQ ID:4429.

[57918] Another function of VGAM1718 is therefore inhibition of FLJ00001 (Accession XM\_088525). Accordingly, utilities of VGAM1718 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00001. FLJ21562 (Accession NM\_025113) is another VGAM1718 host target gene. FLJ21562 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ21562, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21562 BINDING SITE, designated SEQ ID:24761, to the nucleotide sequence of VGAM1718 RNA, herein designated VGAM RNA, also designated SEQ ID:4429.

[57919] Another function of VGAM1718 is therefore inhibition of FLJ21562 (Accession NM\_025113). Accordingly, utilities of VGAM1718 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21562. KIAA0350 (Accession XM\_028332) is another VGAM1718 host target gene. KIAA0350 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0350, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0350 BINDING SITE, designated SEQ ID:30658, to the nucleotide sequence of VGAM1718 RNA, herein designated VGAM RNA, also designated SEQ ID:4429.

[57920] Another function of VGAM1718 is therefore inhibition of KIAA0350 (Accession XM\_028332). Accordingly, utilities of VGAM1718 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0350. KIAA0513 (Accession NM\_014732) is another VGAM1718 host target gene. KIAA0513 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0513, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0513 BINDING SITE, designated SEQ ID:16351, to the nucleotide sequence of VGAM1718 RNA, herein designated VGAM RNA, also designated SEQ ID:4429.

[57921] Another function of VGAM1718 is therefore inhibition of

KIAA0513 (Accession NM\_014732). Accordingly, utilities of VGAM1718 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0513. KIAA1297 (Accession XM\_051005) is another VGAM1718 host target gene. KIAA1297 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1297, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1297 BINDING SITE, designated SEQ ID:35714, to the nucleotide sequence of VGAM1718 RNA, herein designated VGAM RNA, also designated SEQ ID:4429.

[57922] Another function of VGAM1718 is therefore inhibition of KIAA1297 (Accession XM\_051005). Accordingly, utilities of VGAM1718 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1297. KIAA1813 (Accession XM\_046743) is another VGAM1718 host target gene. KIAA1813 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1813, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1813 BINDING SITE, designated SEQ ID:34813, to the nucleotide sequence of VGAM1718 RNA, herein designated VGAM RNA, also designated SEQ ID:4429.

[57923] Another function of VGAM1718 is therefore inhibition of KIAA1813 (Accession XM\_046743). Accordingly, utilities of VGAM1718 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1813. KIAA1977 (Accession XM\_058800) is another VGAM1718 host target gene. KIAA1977 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1977, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1977 BINDING SITE, designated SEQ ID:36748, to the nucleotide sequence of VGAM1718 RNA, herein designated VGAM RNA, also designated SEQ ID:4429.

[57924] Another function of VGAM1718 is therefore inhibition of KIAA1977 (Accession XM\_058800). Accordingly, utilities of VGAM1718 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1977. MOT8 (Accession NM\_018836) is another

VGAM1718 host target gene. MOT8 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MOT8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MOT8 BINDING SITE, designated SEQ ID:20823, to the nucleotide sequence of VGAM1718 RNA, herein designated VGAM RNA, also designated SEQ ID:4429.

[57925] Another function of VGAM1718 is therefore inhibition of MOT8 (Accession NM\_018836). Accordingly, utilities of VGAM1718 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MOT8. Obscurin, Cytoskeletal Calmodulin and Titin-interacting RhoGEF (OBSCN, Accession XM\_047536) is another VGAM1718 host target gene. OBSCN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OBSCN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OBSCN BINDING SITE, designated SEQ ID:34990, to the nucleotide sequence of VGAM1718 RNA, herein designated VGAM RNA,

also designated SEQ ID:4429.

[57926] Another function of VGAM1718 is therefore inhibition of Obscurin, Cytoskeletal Calmodulin and Titin-interacting RhoGEF (OBSCN, Accession XM\_047536). Accordingly, utilities of VGAM1718 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OBSCN. Retinoic Acid Induced 16 (RAI16, Accession NM\_022749) is another VGAM1718 host target gene. RAI16 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAI16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAI16 BINDING SITE, designated SEQ ID:22968, to the nucleotide sequence of VGAM1718 RNA, herein designated VGAM RNA, also designated SEQ ID:4429.

[57927] Another function of VGAM1718 is therefore inhibition of Retinoic Acid Induced 16 (RAI16, Accession NM\_022749). Accordingly, utilities of VGAM1718 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAI16. RHO6 (Accession NM\_014470) is another VGAM1718 host target gene. RHO6 BINDING SITE is HOST TARGET binding site found in

the 3` untranslated region of mRNA encoded by RHO6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RHO6 BINDING SITE, designated SEQ ID:15820, to the nucleotide sequence of VGAM1718 RNA, herein designated VGAM RNA, also designated SEQ ID:4429.

[57928] Another function of VGAM1718 is therefore inhibition of RHO6 (Accession NM\_014470). Accordingly, utilities of VGAM1718 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RHO6. LOC125704 (Accession XM\_058931) is another VGAM1718 host target gene. LOC125704 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC125704, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC125704 BINDING SITE, designated SEQ ID:36796, to the nucleotide sequence of VGAM1718 RNA, herein designated VGAM RNA, also designated SEQ ID:4429.

[57929] Another function of VGAM1718 is therefore inhibition of LOC125704 (Accession XM\_058931). Accordingly, utilities

of VGAM1718 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC125704. LOC126917 (Accession XM\_059091) is another VGAM1718 host target gene. LOC126917 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC126917, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126917 BINDING SITE, designated SEQ ID:36869, to the nucleotide sequence of VGAM1718 RNA, herein designated VGAM RNA, also designated SEQ ID:4429.

[57930] Another function of VGAM1718 is therefore inhibition of LOC126917 (Accession XM\_059091). Accordingly, utilities of VGAM1718 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126917. LOC146782 (Accession XM\_083963) is another VGAM1718 host target gene. LOC146782 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC146782, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC146782 BINDING SITE, designated SEQ ID:37523, to the nucleotide sequence of VGAM1718 RNA, herein designated VGAM RNA, also designated SEQ ID:4429.

[57931] Another function of VGAM1718 is therefore inhibition of LOC146782 (Accession XM\_083963). Accordingly, utilities of VGAM1718 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146782. LOC152078 (Accession XM\_087376) is another VGAM1718 host target gene. LOC152078 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152078, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152078 BINDING SITE, designated SEQ ID:39212, to the nucleotide sequence of VGAM1718 RNA, herein designated VGAM RNA, also designated SEQ ID:4429.

[57932] Another function of VGAM1718 is therefore inhibition of LOC152078 (Accession XM\_087376). Accordingly, utilities of VGAM1718 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152078. LOC200014 (Accession XM\_114087) is another VGAM1718 host target gene. LOC200014 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200014 BINDING SITE, designated SEQ ID:42688, to the nucleotide sequence of VGAM1718 RNA, herein designated VGAM RNA, also designated SEQ ID:4429.

[57933] Another function of VGAM1718 is therefore inhibition of LOC200014 (Accession XM\_114087). Accordingly, utilities of VGAM1718 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200014. LOC255397 (Accession XM\_173868) is another VGAM1718 host target gene. LOC255397 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255397, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255397 BINDING SITE, designated SEQ ID:46565, to the nucleotide sequence of VGAM1718 RNA, herein designated VGAM RNA, also designated SEQ ID:4429.

[57934] Another function of VGAM1718 is therefore inhibition of

LOC255397 (Accession XM\_173868). Accordingly, utilities of VGAM1718 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255397. LOC256158 (Accession XM\_175125) is another VGAM1718 host target gene. LOC256158 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256158, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256158 BINDING SITE, designated SEQ ID:46616, to the nucleotide sequence of VGAM1718 RNA, herein designated VGAM RNA, also designated SEQ ID:4429.

[57935] Another function of VGAM1718 is therefore inhibition of LOC256158 (Accession XM\_175125). Accordingly, utilities of VGAM1718 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256158. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1719 (VGAM1719) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[57936] VGAM1719 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1719 was detected is described hereinabove with reference to Figs. 1–8.

[57937] VGAM1719 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat Cytomegalovirus. VGAM1719 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[57938] VGAM1719 gene encodes a VGAM1719 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1719 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1719 precursor RNA is designated SEQ ID:1705, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1705 is located at position 110474 relative to the genome of Rat Cytomegalovirus.

[57939] VGAM1719 precursor RNA folds onto itself, forming VGAM1719 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two–

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[57940] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1719 folded precursor RNA into VGAM1719 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1719 RNA is designated SEQ ID:4430, and is provided hereinbelow with reference to the sequence listing part.

[57941] VGAM1719 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1719 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1719 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[57942] VGAM1719 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1719 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1719 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1719 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1719 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[57943] The complementary binding of VGAM1719 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1719 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1719 host target RNA into VGAM1719 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[57944] It is appreciated that VGAM1719 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1719 host target genes. The mRNA of each one of this plurality of VGAM1719 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1719 RNA, herein designated VGAM RNA, and which when bound by VGAM1719 RNA causes inhibition of translation of respective one or more VGAM1719 host target proteins.

[57945] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1719 gene, herein designated VGAM GENE, on one

or more VGAM1719 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[57946] It is yet further appreciated that a function of VGAM1719 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1719 include diagnosis, prevention and treatment of viral infection by Rat Cytomegalovirus. Specific functions, and accordingly utilities, of VGAM1719 correlate with, and may be deduced from, the identity of the host target genes which VGAM1719 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[57947] Nucleotide sequences of the VGAM1719 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1719 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1719 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1719 are further described hereinbelow with reference to Table 1.

[57948] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1719 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1719 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[57949] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1719 gene, herein designated VGAM is inhibition of expression of VGAM1719 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1719 correlate with, and may be deduced from, the identity of the target genes which VGAM1719 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[57950] PYGO2 (Accession XM\_034083) is a VGAM1719 host tar-

get gene. PYGO2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PYGO2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PYGO2 BINDING SITE, designated SEQ ID:31999, to the nucleotide sequence of VGAM1719 RNA, herein designated VGAM RNA, also designated SEQ ID:4430.

[57951] A function of VGAM1719 is therefore inhibition of PYGO2 (Accession XM\_034083). Accordingly, utilities of VGAM1719 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PYGO2. Suppression of Tumorigenicity 7 (ST7, Accession NM\_018412) is another VGAM1719 host target gene. ST7 BINDING SITE1 and ST7 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ST7, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ST7 BINDING SITE1 and ST7 BINDING SITE2, designated SEQ ID:20455 and SEQ ID:22431 respectively, to the nucleotide sequence of VGAM1719

RNA, herein designated VGAM RNA, also designated SEQ ID:4430.

[57952] Another function of VGAM1719 is therefore inhibition of Suppression of Tumorigenicity 7 (ST7, Accession NM\_018412), a gene which has a role in regulating cell–environment or cell–cell interactions. Accordingly, utilities of VGAM1719 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ST7. The function of ST7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM107.DKFZp434O0515 (Accession XM\_038277) is another VGAM1719 host target gene. DKFZp434O0515 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZp434O0515, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434O0515 BINDING SITE, designated SEQ ID:32786, to the nucleotide sequence of VGAM1719 RNA, herein designated VGAM RNA, also designated SEQ ID:4430.

[57953] Another function of VGAM1719 is therefore inhibition of

DKFZp434O0515 (Accession XM\_038277). Accordingly, utilities of VGAM1719 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434O0515. KIAA1161 (Accession XM\_088501) is another VGAM1719 host target gene. KIAA1161 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1161, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1161 BINDING SITE, designated SEQ ID:39753, to the nucleotide sequence of VGAM1719 RNA, herein designated VGAM RNA, also designated SEQ ID:4430.

[57954] Another function of VGAM1719 is therefore inhibition of KIAA1161 (Accession XM\_088501). Accordingly, utilities of VGAM1719 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1161. MAD, Mothers Against Decapentaplegic Homolog (Drosophila) Interacting Protein, Receptor Activation Anchor (MADHIP, Accession NM\_007323) is another VGAM1719 host target gene. MADHIP BINDING SITE1 through MADHIP BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by

MADHIP, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MADHIP BINDING SITE1 through MADHIP BINDING SITE3, designated SEQ ID:14241, SEQ ID:14243 and SEQ ID:11220 respectively, to the nucleotide sequence of VGAM1719 RNA, herein designated VGAM RNA, also designated SEQ ID:4430.

[57955] Another function of VGAM1719 is therefore inhibition of MAD, Mothers Against Decapentaplegic Homolog (Drosophila) Interacting Protein, Receptor Activation Anchor (MADHIP, Accession NM\_007323). Accordingly, utilities of VGAM1719 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MADHIP. LOC124216 (Accession XM\_058783) is another VGAM1719 host target gene. LOC124216 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC124216, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124216 BINDING SITE, designated SEQ ID:36739, to the nucleotide sequence of VGAM1719 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4430.

[57956] Another function of VGAM1719 is therefore inhibition of LOC124216 (Accession XM\_058783). Accordingly, utilities of VGAM1719 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124216. LOC147071 (Accession XM\_054031) is another VGAM1719 host target gene. LOC147071 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147071, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147071 BINDING SITE, designated SEQ ID:36137, to the nucleotide sequence of VGAM1719 RNA, herein designated VGAM RNA, also designated SEQ ID:4430.

[57957] Another function of VGAM1719 is therefore inhibition of LOC147071 (Accession XM\_054031). Accordingly, utilities of VGAM1719 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147071. LOC201173 (Accession XM\_113312) is another VGAM1719 host target gene. LOC201173 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC201173, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201173 BINDING SITE, designated SEQ ID:42216, to the nucleotide sequence of VGAM1719 RNA, herein designated VGAM RNA, also designated SEQ ID:4430.

[57958] Another function of VGAM1719 is therefore inhibition of LOC201173 (Accession XM\_113312). Accordingly, utilities of VGAM1719 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201173. LOC201220 (Accession XM\_113321) is another VGAM1719 host target gene. LOC201220 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC201220, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201220 BINDING SITE, designated SEQ ID:42223, to the nucleotide sequence of VGAM1719 RNA, herein designated VGAM RNA, also designated SEQ ID:4430.

[57959] Another function of VGAM1719 is therefore inhibition of LOC201220 (Accession XM\_113321). Accordingly, utilities of VGAM1719 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC201220. LOC203504 (Accession XM\_117550) is another VGAM1719 host target gene. LOC203504 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203504, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203504 BINDING SITE, designated SEQ ID:43570, to the nucleotide sequence of VGAM1719 RNA, herein designated VGAM RNA, also designated SEQ ID:4430.

[57960] Another function of VGAM1719 is therefore inhibition of LOC203504 (Accession XM\_117550). Accordingly, utilities of VGAM1719 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203504. LOC256682 (Accession XM\_174473) is another VGAM1719 host target gene. LOC256682 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256682, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256682 BINDING SITE, designated SEQ ID:46593, to

the nucleotide sequence of VGAM1719 RNA, herein designated VGAM RNA, also designated SEQ ID:4430.

[57961] Another function of VGAM1719 is therefore inhibition of LOC256682 (Accession XM\_174473). Accordingly, utilities of VGAM1719 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256682. LOC257451 (Accession XM\_170960) is another VGAM1719 host target gene. LOC257451 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257451, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257451 BINDING SITE, designated SEQ ID:45742, to the nucleotide sequence of VGAM1719 RNA, herein designated VGAM RNA, also designated SEQ ID:4430.

[57962] Another function of VGAM1719 is therefore inhibition of LOC257451 (Accession XM\_170960). Accordingly, utilities of VGAM1719 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257451. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 1720 (VGAM1720) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[57963] VGAM1720 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1720 was detected is described hereinabove with reference to Figs. 1–8.

[57964] VGAM1720 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat Cytomegalovirus. VGAM1720 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[57965] VGAM1720 gene encodes a VGAM1720 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1720 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1720 precursor RNA is designated SEQ ID:1706, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1706 is located at position 111844 relative to the genome of Rat Cytomegalovirus.

[57966] VGAM1720 precursor RNA folds onto itself, forming VGAM1720 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[57967] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1720 folded precursor RNA into VGAM1720 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1720 RNA is designated SEQ ID:4431, and is provided hereinbelow with reference to the sequence listing part.

[57968] VGAM1720 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1720 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1720 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[57969] VGAM1720 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1720 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1720 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1720 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1720 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[57970] The complementary binding of VGAM1720 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1720 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1720 host target RNA into VGAM1720 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[57971] It is appreciated that VGAM1720 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1720 host target genes. The mRNA of each one of this plurality of VGAM1720 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1720 RNA, herein designated VGAM RNA, and which when bound by VGAM1720 RNA causes inhibition of translation of respective one or more VGAM1720 host target proteins.

[57972] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1720 gene, herein designated VGAM GENE, on one or more VGAM1720 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[57973] It is yet further appreciated that a function of VGAM1720 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1720 include diagnosis, prevention and treatment of viral infection by Rat Cytomegalovirus. Specific functions, and accordingly utilities, of VGAM1720 correlate with, and may be deduced from, the identity of

the host target genes which VGAM1720 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[57974] Nucleotide sequences of the VGAM1720 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1720 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1720 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1720 are further described hereinbelow with reference to Table 1.

[57975] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1720 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1720 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[57976] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1720 gene, herein designated VGAM is inhibition of expression of VGAM1720 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1720 correlate with, and may be deduced from, the identity of the target genes which VGAM1720

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[57977] ACK1 (Accession NM\_005781) is a VGAM1720 host target gene. ACK1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ACK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACK1 BINDING SITE, designated SEQ ID:12360, to the nucleotide sequence of VGAM1720 RNA, herein designated VGAM RNA, also designated SEQ ID:4431.

[57978] A function of VGAM1720 is therefore inhibition of ACK1 (Accession NM\_005781). Accordingly, utilities of VGAM1720 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACK1. Ankyrin 1, Erythrocytic (ANK1, Accession XM\_016774) is another VGAM1720 host target gene. ANK1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ANK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ANK1 BINDING SITE, designated SEQ ID:30285, to the nucleotide se-

quence of VGAM1720 RNA, herein designated VGAM RNA, also designated SEQ ID:4431.

[57979] Another function of VGAM1720 is therefore inhibition of Ankyrin 1, Erythrocytic (ANK1, Accession XM\_016774). Accordingly, utilities of VGAM1720 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANK1. Axin 1 (AXIN1, Accession XM\_027520) is another VGAM1720 host target gene. AXIN1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by AXIN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AXIN1 BINDING SITE, designated SEQ ID:30515, to the nucleotide sequence of VGAM1720 RNA, herein designated VGAM RNA, also designated SEQ ID:4431.

[57980] Another function of VGAM1720 is therefore inhibition of Axin 1 (AXIN1, Accession XM\_027520). Accordingly, utilities of VGAM1720 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AXIN1. AXIN1 Up-regulated 1 (AXUD1, Accession NM\_033027) is another VGAM1720 host target gene.

AXUD1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by AXUD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AXUD1 BINDING SITE, designated SEQ ID:26920, to the nucleotide sequence of VGAM1720 RNA, herein designated VGAM RNA, also designated SEQ ID:4431.

[57981] Another function of VGAM1720 is therefore inhibition of AXIN1 Up-regulated 1 (AXUD1, Accession NM\_033027). Accordingly, utilities of VGAM1720 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AXUD1. Bone Morphogenetic Protein 4 (BMP4, Accession NM\_130850) is another VGAM1720 host target gene. BMP4 BINDING SITE1 and BMP4 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by BMP4, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BMP4 BINDING SITE1 and BMP4 BINDING SITE2, designated SEQ ID:28387 and SEQ ID:6866 respectively, to the nucleotide

sequence of VGAM1720 RNA, herein designated VGAM RNA, also designated SEQ ID:4431.

[57982] Another function of VGAM1720 is therefore inhibition of Bone Morphogenetic Protein 4 (BMP4, Accession NM\_130850), a gene which acts in mesoderm induction, tooth development, limb formation and fracture repair. Accordingly, utilities of VGAM1720 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BMP4. The function of BMP4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM910. Dual-specificity tyrosine-(Y)-phosphorylation Regulated Kinase 2 (DYRK2, Accession NM\_006482) is another VGAM1720 host target gene. DYRK2 BINDING SITE1 and DYRK2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DYRK2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DYRK2 BINDING SITE1 and DYRK2 BINDING SITE2, designated SEQ ID:13209 and SEQ ID:9633 respectively, to the nucleotide sequence of VGAM1720 RNA, herein designated VGAM

RNA, also designated SEQ ID:4431.

[57983] Another function of VGAM1720 is therefore inhibition of Dual-specificity tyrosine-(Y)-phosphorylation Regulated Kinase 2 (DYRK2, Accession NM\_006482). Accordingly, utilities of VGAM1720 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DYRK2. E1A Binding Protein P300 (EP300, Accession NM\_001429) is another VGAM1720 host target gene. EP300 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EP300, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EP300 BINDING SITE, designated SEQ ID:7152, to the nucleotide sequence of VGAM1720 RNA, herein designated VGAM RNA, also designated SEQ ID:4431.

[57984] Another function of VGAM1720 is therefore inhibition of E1A Binding Protein P300 (EP300, Accession NM\_001429), a gene which may have a function in cell cycle regulation. Accordingly, utilities of VGAM1720 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EP300. The function of EP300 and its association with various diseases and clinical conditions,

has been established by previous studies, as described hereinabove with reference to VGAM191. Frizzled Homolog 1 (Drosophila) (FZD1, Accession NM\_003505) is another VGAM1720 host target gene. FZD1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FZD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FZD1 BINDING SITE, designated SEQ ID:9593, to the nucleotide sequence of VGAM1720 RNA, herein designated VGAM RNA, also designated SEQ ID:4431.

[57985] Another function of VGAM1720 is therefore inhibition of Frizzled Homolog 1 (Drosophila) (FZD1, Accession NM\_003505), a gene which may be involved in bone resorption; strongly similar to rat Fzd. Accordingly, utilities of VGAM1720 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FZD1. The function of FZD1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM432. UDP-N-acetyl-alpha-D-galactosamine:(N-acety

Ineuraminyl)-galactosylglucosylceramide N-  
 acetylgalactosaminyltransferase (GalNAc-T) (GALGT, Ac-  
 cession NM\_001478) is another VGAM1720 host target  
 gene. GALGT BINDING SITE is HOST TARGET binding site  
 found in the 5` untranslated region of mRNA encoded by  
 GALGT, corresponding to a HOST TARGET binding site  
 such as BINDING SITE I, BINDING SITE II or BINDING SITE III.  
 Table 2 illustrates the complementarity of the nucleotide  
 sequences of GALGT BINDING SITE, designated SEQ  
 ID:7212, to the nucleotide sequence of VGAM1720 RNA,  
 herein designated VGAM RNA, also designated SEQ  
 ID:4431.

[57986] Another function of VGAM1720 is therefore inhibition of  
 UDP-  
 N-  
 acetyl-al-  
 pha-  
 D-galac-  
 tosamine:(N-acetylneuraminyl)-galactosylglucosylceramid  
 e N-acetylgalactosaminyltransferase (GalNAc-T) (GALGT,  
 Accession NM\_001478), a gene which is involved in the  
 biosynthesis of gangliosides gm2, gd2 and ga2. Accord-  
 ingly, utilities of VGAM1720 include diagnosis, prevention

and treatment of diseases and clinical conditions associated with GALGT. The function of GALGT and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM179. Potassium Voltage-gated Channel, Shaker-related Subfamily, Member 6 (KCNA6, Accession NM\_002235) is another VGAM1720 host target gene. KCNA6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KCNA6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNA6 BINDING SITE, designated SEQ ID:8017, to the nucleotide sequence of VGAM1720 RNA, herein designated VGAM RNA, also designated SEQ ID:4431.

[57987] Another function of VGAM1720 is therefore inhibition of Potassium Voltage-gated Channel, Shaker-related Subfamily, Member 6 (KCNA6, Accession NM\_002235), a gene which mediates the voltage-dependent potassium ion permeability of excitable membranes. Accordingly, utilities of VGAM1720 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with KCNA6. The function of KCNA6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM893. Mannosidase, Alpha, Class 2A, Member 1 (MAN2A1, Accession NM\_002372) is another VGAM1720 host target gene. MAN2A1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MAN2A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAN2A1 BINDING SITE, designated SEQ ID:8179, to the nucleotide sequence of VGAM1720 RNA, herein designated VGAM RNA, also designated SEQ ID:4431.

[57988] Another function of VGAM1720 is therefore inhibition of Mannosidase, Alpha, Class 2A, Member 1 (MAN2A1, Accession NM\_002372), a gene which catalyzes the final hydrolytic step in the asparagine-linked oligosaccharide (N-glycan) maturation pathway. Accordingly, utilities of VGAM1720 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAN2A1. The function of MAN2A1 and its association with various diseases and clinical conditions, has been es-

established by previous studies, as described hereinabove with reference to VGAM1410. Protein Kinase, AMP-activated, Beta 1 Non-catalytic Subunit (PRKAB1, Accession NM\_006253) is another VGAM1720 host target gene. PRKAB1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRKAB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRKAB1 BINDING SITE, designated SEQ ID:12930, to the nucleotide sequence of VGAM1720 RNA, herein designated VGAM RNA, also designated SEQ ID:4431.

[57989] Another function of VGAM1720 is therefore inhibition of Protein Kinase, AMP-activated, Beta 1 Non-catalytic Subunit (PRKAB1, Accession NM\_006253), a gene which is responsible for the regulation of fatty acid synthesis by phosphorylation of acetyl-coa carboxylase. Accordingly, utilities of VGAM1720 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKAB1. The function of PRKAB1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove

with reference to VGAM1384.SORCS2 (Accession NM\_020777) is another VGAM1720 host target gene. SORCS2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SORCS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SORCS2 BINDING SITE, designated SEQ ID:21878, to the nucleotide sequence of VGAM1720 RNA, herein designated VGAM RNA, also designated SEQ ID:4431.

[57990] Another function of VGAM1720 is therefore inhibition of SORCS2 (Accession NM\_020777). Accordingly, utilities of VGAM1720 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SORCS2. Zinc Finger Protein 26 (KOX 20) (ZNF26, Accession XM\_053907) is another VGAM1720 host target gene. ZNF26 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ZNF26, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF26 BINDING SITE, designated SEQ

ID:36130, to the nucleotide sequence of VGAM1720 RNA, herein designated VGAM RNA, also designated SEQ ID:4431.

[57991] Another function of VGAM1720 is therefore inhibition of Zinc Finger Protein 26 (KOX 20) (ZNF26, Accession XM\_053907), a gene which may be involved in transcriptional regulation. Accordingly, utilities of VGAM1720 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF26. The function of ZNF26 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1533.Chromosome 21 Open Reading Frame 93 (C21orf93, Accession NM\_145179) is another VGAM1720 host target gene. C21orf93 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by C21orf93, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C21orf93 BINDING SITE, designated SEQ ID:29742, to the nucleotide sequence of VGAM1720 RNA, herein designated VGAM RNA, also designated SEQ ID:4431.

[57992] Another function of VGAM1720 is therefore inhibition of Chromosome 21 Open Reading Frame 93 (C21orf93, Accession NM\_145179). Accordingly, utilities of VGAM1720 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C21orf93. Caspase Recruitment Domain Family, Member 9 (CARD9, Accession NM\_022352) is another VGAM1720 host target gene. CARD9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CARD9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CARD9 BINDING SITE, designated SEQ ID:22748, to the nucleotide sequence of VGAM1720 RNA, herein designated VGAM RNA, also designated SEQ ID:4431.

[57993] Another function of VGAM1720 is therefore inhibition of Caspase Recruitment Domain Family, Member 9 (CARD9, Accession NM\_022352). Accordingly, utilities of VGAM1720 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CARD9. CASKIN1 (Accession NM\_020764) is another VGAM1720 host target gene. CASKIN1 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by CASKIN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CASKIN1 BINDING SITE, designated SEQ ID:21864, to the nucleotide sequence of VGAM1720 RNA, herein designated VGAM RNA, also designated SEQ ID:4431.

[57994] Another function of VGAM1720 is therefore inhibition of CASKIN1 (Accession NM\_020764). Accordingly, utilities of VGAM1720 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CASKIN1. DED (Accession NM\_012138) is another VGAM1720 host target gene. DED BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DED, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DED BINDING SITE, designated SEQ ID:14448, to the nucleotide sequence of VGAM1720 RNA, herein designated VGAM RNA, also designated SEQ ID:4431.

[57995] Another function of VGAM1720 is therefore inhibition of

DED (Accession NM\_012138). Accordingly, utilities of VGAM1720 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DED. FLJ00001 (Accession XM\_088525) is another VGAM1720 host target gene. FLJ00001 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ00001, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ00001 BINDING SITE, designated SEQ ID:39777, to the nucleotide sequence of VGAM1720 RNA, herein designated VGAM RNA, also designated SEQ ID:4431.

[57996] Another function of VGAM1720 is therefore inhibition of FLJ00001 (Accession XM\_088525). Accordingly, utilities of VGAM1720 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00001. FLJ12355 (Accession NM\_024988) is another VGAM1720 host target gene. FLJ12355 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ12355, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of FLJ12355 BINDING SITE, designated SEQ ID:24543, to the nucleotide sequence of VGAM1720 RNA, herein designated VGAM RNA, also designated SEQ ID:4431.

[57997] Another function of VGAM1720 is therefore inhibition of FLJ12355 (Accession NM\_024988). Accordingly, utilities of VGAM1720 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12355. FLJ12895 (Accession NM\_023926) is another VGAM1720 host target gene. FLJ12895 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ12895, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12895 BINDING SITE, designated SEQ ID:23405, to the nucleotide sequence of VGAM1720 RNA, herein designated VGAM RNA, also designated SEQ ID:4431.

[57998] Another function of VGAM1720 is therefore inhibition of FLJ12895 (Accession NM\_023926). Accordingly, utilities of VGAM1720 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12895. FLJ13072 (Accession XM\_117117) is another

VGAM1720 host target gene. FLJ13072 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ13072, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13072 BINDING SITE, designated SEQ ID:43234, to the nucleotide sequence of VGAM1720 RNA, herein designated VGAM RNA, also designated SEQ ID:4431.

[57999] Another function of VGAM1720 is therefore inhibition of FLJ13072 (Accession XM\_117117). Accordingly, utilities of VGAM1720 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13072. FLJ20374 (Accession NM\_017793) is another VGAM1720 host target gene. FLJ20374 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ20374, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20374 BINDING SITE, designated SEQ ID:19430, to the nucleotide sequence of VGAM1720 RNA, herein designated VGAM RNA, also designated SEQ ID:4431.

[58000] Another function of VGAM1720 is therefore inhibition of FLJ20374 (Accession NM\_017793). Accordingly, utilities of VGAM1720 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20374. FLJ20730 (Accession NM\_017945) is another VGAM1720 host target gene. FLJ20730 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20730, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20730 BINDING SITE, designated SEQ ID:19640, to the nucleotide sequence of VGAM1720 RNA, herein designated VGAM RNA, also designated SEQ ID:4431.

[58001] Another function of VGAM1720 is therefore inhibition of FLJ20730 (Accession NM\_017945). Accordingly, utilities of VGAM1720 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20730. FLJ21596 (Accession NM\_024823) is another VGAM1720 host target gene. FLJ21596 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21596, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21596 BINDING SITE, designated SEQ ID:24213, to the nucleotide sequence of VGAM1720 RNA, herein designated VGAM RNA, also designated SEQ ID:4431.

[58002] Another function of VGAM1720 is therefore inhibition of FLJ21596 (Accession NM\_024823). Accordingly, utilities of VGAM1720 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21596. HRIHFB2122 (Accession NM\_007032) is another VGAM1720 host target gene. HRIHFB2122 BINDING SITE1 and HRIHFB2122 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by HRIHFB2122, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HRIHFB2122 BINDING SITE1 and HRIHFB2122 BINDING SITE2, designated SEQ ID:13901 and SEQ ID:28904 respectively, to the nucleotide sequence of VGAM1720 RNA, herein designated VGAM RNA, also designated SEQ ID:4431.

[58003] Another function of VGAM1720 is therefore inhibition of HRIHFB2122 (Accession NM\_007032). Accordingly, utili-

ties of VGAM1720 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HRIHFB2122. KIAA0844 (Accession NM\_014951) is another VGAM1720 host target gene. KIAA0844 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0844, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0844 BINDING SITE, designated SEQ ID:17283, to the nucleotide sequence of VGAM1720 RNA, herein designated VGAM RNA, also designated SEQ ID:4431.

[58004] Another function of VGAM1720 is therefore inhibition of KIAA0844 (Accession NM\_014951). Accordingly, utilities of VGAM1720 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0844. KIAA1319 (Accession NM\_020770) is another VGAM1720 host target gene. KIAA1319 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1319, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1319 BINDING SITE, designated SEQ ID:21867, to the nucleotide sequence of VGAM1720 RNA, herein designated VGAM RNA, also designated SEQ ID:4431.

[58005] Another function of VGAM1720 is therefore inhibition of KIAA1319 (Accession NM\_020770). Accordingly, utilities of VGAM1720 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1319. MGC15437 (Accession NM\_032873) is another VGAM1720 host target gene. MGC15437 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC15437, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC15437 BINDING SITE, designated SEQ ID:26689, to the nucleotide sequence of VGAM1720 RNA, herein designated VGAM RNA, also designated SEQ ID:4431.

[58006] Another function of VGAM1720 is therefore inhibition of MGC15437 (Accession NM\_032873). Accordingly, utilities of VGAM1720 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15437. MGC2705 (Accession NM\_032701) is another VGAM1720 host target gene. MGC2705 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC2705, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2705 BINDING SITE, designated SEQ ID:26417, to the nucleotide sequence of VGAM1720 RNA, herein designated VGAM RNA, also designated SEQ ID:4431.

[58007] Another function of VGAM1720 is therefore inhibition of MGC2705 (Accession NM\_032701). Accordingly, utilities of VGAM1720 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2705. MOT8 (Accession NM\_018836) is another VGAM1720 host target gene. MOT8 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MOT8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MOT8 BINDING SITE, designated SEQ ID:20824, to the nucleotide sequence of VGAM1720 RNA, herein designated VGAM RNA, also designated SEQ ID:4431.

[58008] Another function of VGAM1720 is therefore inhibition of

MOT8 (Accession NM\_018836). Accordingly, utilities of VGAM1720 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MOT8. Ras and Rab Interactor 3 (RIN3, Accession NM\_024832) is another VGAM1720 host target gene. RIN3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RIN3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RIN3 BINDING SITE, designated SEQ ID:24231, to the nucleotide sequence of VGAM1720 RNA, herein designated VGAM RNA, also designated SEQ ID:4431.

[58009] Another function of VGAM1720 is therefore inhibition of Ras and Rab Interactor 3 (RIN3, Accession NM\_024832). Accordingly, utilities of VGAM1720 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RIN3. RP4-622L5 (Accession NM\_019118) is another VGAM1720 host target gene. RP4-622L5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RP4-622L5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of RP4-622L5 BINDING SITE, designated SEQ ID:21202, to the nucleotide sequence of VGAM1720 RNA, herein designated VGAM RNA, also designated SEQ ID:4431.

[58010] Another function of VGAM1720 is therefore inhibition of RP4-622L5 (Accession NM\_019118). Accordingly, utilities of VGAM1720 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RP4-622L5. Sema Domain, Immunoglobulin Domain (Ig), and GPI Membrane Anchor, (semaphorin) 7A (SEMA7A, Accession NM\_003612) is another VGAM1720 host target gene. SEMA7A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEMA7A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEMA7A BINDING SITE, designated SEQ ID:9664, to the nucleotide sequence of VGAM1720 RNA, herein designated VGAM RNA, also designated SEQ ID:4431.

[58011] Another function of VGAM1720 is therefore inhibition of Sema Domain, Immunoglobulin Domain (Ig), and GPI

Membrane Anchor, (semaphorin) 7A (SEMA7A, Accession NM\_003612). Accordingly, utilities of VGAM1720 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA7A. Syntaxin 11 (STX11, Accession NM\_003764) is another VGAM1720 host target gene. STX11 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by STX11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STX11 BINDING SITE, designated SEQ ID:9842, to the nucleotide sequence of VGAM1720 RNA, herein designated VGAM RNA, also designated SEQ ID:4431.

[58012] Another function of VGAM1720 is therefore inhibition of Syntaxin 11 (STX11, Accession NM\_003764). Accordingly, utilities of VGAM1720 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STX11. T2BP (Accession XM\_046111) is another VGAM1720 host target gene. T2BP BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by T2BP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of T2BP BINDING SITE, designated SEQ ID:34681, to the nucleotide sequence of VGAM1720 RNA, herein designated VGAM RNA, also designated SEQ ID:4431.

[58013] Another function of VGAM1720 is therefore inhibition of T2BP (Accession XM\_046111). Accordingly, utilities of VGAM1720 include diagnosis, prevention and treatment of diseases and clinical conditions associated with T2BP. Three Prime Repair Exonuclease 2 (TREX2, Accession NM\_080699) is another VGAM1720 host target gene. TREX2 BINDING SITE1 and TREX2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TREX2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TREX2 BINDING SITE1 and TREX2 BINDING SITE2, designated SEQ ID:27988 and SEQ ID:14069 respectively, to the nucleotide sequence of VGAM1720 RNA, herein designated VGAM RNA, also designated SEQ ID:4431.

[58014] Another function of VGAM1720 is therefore inhibition of Three Prime Repair Exonuclease 2 (TREX2, Accession

NM\_080699). Accordingly, utilities of VGAM1720 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TREX2. LOC143666 (Accession XM\_096465) is another VGAM1720 host target gene. LOC143666 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC143666, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143666 BINDING SITE, designated SEQ ID:40370, to the nucleotide sequence of VGAM1720 RNA, herein designated VGAM RNA, also designated SEQ ID:4431.

[58015] Another function of VGAM1720 is therefore inhibition of LOC143666 (Accession XM\_096465). Accordingly, utilities of VGAM1720 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143666. LOC146138 (Accession XM\_096938) is another VGAM1720 host target gene. LOC146138 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146138, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC146138 BINDING SITE, designated SEQ ID:40656, to the nucleotide sequence of VGAM1720 RNA, herein designated VGAM RNA, also designated SEQ ID:4431.

[58016] Another function of VGAM1720 is therefore inhibition of LOC146138 (Accession XM\_096938). Accordingly, utilities of VGAM1720 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146138. LOC148132 (Accession XM\_097408) is another VGAM1720 host target gene. LOC148132 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148132, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148132 BINDING SITE, designated SEQ ID:40869, to the nucleotide sequence of VGAM1720 RNA, herein designated VGAM RNA, also designated SEQ ID:4431.

[58017] Another function of VGAM1720 is therefore inhibition of LOC148132 (Accession XM\_097408). Accordingly, utilities of VGAM1720 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148132. LOC148229 (Accession XM\_086103) is an-

other VGAM1720 host target gene. LOC148229 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148229, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148229 BINDING SITE, designated SEQ ID:38496, to the nucleotide sequence of VGAM1720 RNA, herein designated VGAM RNA, also designated SEQ ID:4431.

[58018] Another function of VGAM1720 is therefore inhibition of LOC148229 (Accession XM\_086103). Accordingly, utilities of VGAM1720 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148229. LOC150935 (Accession XM\_087049) is another VGAM1720 host target gene. LOC150935 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150935, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150935 BINDING SITE, designated SEQ ID:39019, to the nucleotide sequence of VGAM1720 RNA, herein designated VGAM RNA, also designated SEQ ID:4431.

[58019] Another function of VGAM1720 is therefore inhibition of LOC150935 (Accession XM\_087049). Accordingly, utilities of VGAM1720 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150935. LOC151174 (Accession XM\_098013) is another VGAM1720 host target gene. LOC151174 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151174, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151174 BINDING SITE, designated SEQ ID:41311, to the nucleotide sequence of VGAM1720 RNA, herein designated VGAM RNA, also designated SEQ ID:4431.

[58020] Another function of VGAM1720 is therefore inhibition of LOC151174 (Accession XM\_098013). Accordingly, utilities of VGAM1720 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151174. LOC154101 (Accession XM\_094692) is another VGAM1720 host target gene. LOC154101 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC154101, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154101 BINDING SITE, designated SEQ ID:40237, to the nucleotide sequence of VGAM1720 RNA, herein designated VGAM RNA, also designated SEQ ID:4431.

[58021] Another function of VGAM1720 is therefore inhibition of LOC154101 (Accession XM\_094692). Accordingly, utilities of VGAM1720 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154101. LOC202559 (Accession XM\_114504) is another VGAM1720 host target gene. LOC202559 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC202559, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202559 BINDING SITE, designated SEQ ID:42986, to the nucleotide sequence of VGAM1720 RNA, herein designated VGAM RNA, also designated SEQ ID:4431.

[58022] Another function of VGAM1720 is therefore inhibition of LOC202559 (Accession XM\_114504). Accordingly, utilities of VGAM1720 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC202559. LOC221876 (Accession XM\_168220) is another VGAM1720 host target gene. LOC221876 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221876, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221876 BINDING SITE, designated SEQ ID:45077, to the nucleotide sequence of VGAM1720 RNA, herein designated VGAM RNA, also designated SEQ ID:4431.

[58023] Another function of VGAM1720 is therefore inhibition of LOC221876 (Accession XM\_168220). Accordingly, utilities of VGAM1720 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221876. LOC253258 (Accession XM\_172870) is another VGAM1720 host target gene. LOC253258 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253258, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253258 BINDING SITE, designated SEQ ID:46148, to the nucleotide sequence of VGAM1720 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4431.

[58024] Another function of VGAM1720 is therefore inhibition of LOC253258 (Accession XM\_172870). Accordingly, utilities of VGAM1720 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253258. LOC255146 (Accession XM\_170985) is another VGAM1720 host target gene. LOC255146 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255146, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255146 BINDING SITE, designated SEQ ID:45756, to the nucleotide sequence of VGAM1720 RNA, herein designated VGAM RNA, also designated SEQ ID:4431.

[58025] Another function of VGAM1720 is therefore inhibition of LOC255146 (Accession XM\_170985). Accordingly, utilities of VGAM1720 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255146. LOC257478 (Accession XM\_054745) is another VGAM1720 host target gene. LOC257478 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257478, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257478 BINDING SITE, designated SEQ ID:36183, to the nucleotide sequence of VGAM1720 RNA, herein designated VGAM RNA, also designated SEQ ID:4431.

[58026] Another function of VGAM1720 is therefore inhibition of LOC257478 (Accession XM\_054745). Accordingly, utilities of VGAM1720 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257478. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1721 (VGAM1721) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[58027] VGAM1721 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1721 was detected is described hereinabove with reference to Figs. 1-8.

[58028] VGAM1721 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Myxoma Virus.

VGAM1721 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[58029] VGAM1721 gene encodes a VGAM1721 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1721 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1721 precursor RNA is designated SEQ ID:1707, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1707 is located at position 8494 relative to the genome of Myxoma Virus.

[58030] VGAM1721 precursor RNA folds onto itself, forming VGAM1721 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[58031] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM1721 folded precursor RNA into VGAM1721 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1721 RNA is designated SEQ ID:4432, and is provided hereinbelow with reference to the sequence listing part.

[58032] VGAM1721 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1721 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1721 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[58033] VGAM1721 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1721 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1721 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1721 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1721 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[58034] The complementary binding of VGAM1721 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1721 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1721 host target RNA into VGAM1721 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[58035] It is appreciated that VGAM1721 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1721 host target genes. The mRNA of each one of this plurality of VGAM1721 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1721 RNA, herein designated VGAM RNA, and which when bound by VGAM1721 RNA causes inhibition of translation of respective one or more VGAM1721 host target proteins.

[58036] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1721 gene, herein designated VGAM GENE, on one or more VGAM1721 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[58037] It is yet further appreciated that a function of VGAM1721 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1721 include diagnosis, prevention and treatment of viral infection by Myxoma Virus. Specific functions, and accordingly utilities, of VGAM1721 correlate with, and may be deduced from, the identity of the host target genes which VGAM1721 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[58038] Nucleotide sequences of the VGAM1721 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1721 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1721 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1721 are further described hereinbelow with reference to Table 1.

[58039] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1721 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1721 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[58040] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1721 gene, herein designated VGAM is inhibition of expression of VGAM1721 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1721 correlate with, and may be deduced from, the identity of the target genes which VGAM1721 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[58041] G Protein-coupled Receptor 30 (GPR30, Accession NM\_001505) is a VGAM1721 host target gene. GPR30 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPR30, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPR30 BINDING SITE, designated SEQ ID:7250, to the

nucleotide sequence of VGAM1721 RNA, herein designated VGAM RNA, also designated SEQ ID:4432.

[58042] A function of VGAM1721 is therefore inhibition of G Protein-coupled Receptor 30 (GPR30, Accession NM\_001505), a gene which receives chemical signals in cell communication in both CNS and peripheral tissues. Accordingly, utilities of VGAM1721 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR30. The function of GPR30 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM171.FLJ12788 (Accession NM\_022492) is another VGAM1721 host target gene. FLJ12788 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12788, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12788 BINDING SITE, designated SEQ ID:22873, to the nucleotide sequence of VGAM1721 RNA, herein designated VGAM RNA, also designated SEQ ID:4432.

[58043] Another function of VGAM1721 is therefore inhibition of

FLJ12788 (Accession NM\_022492). Accordingly, utilities of VGAM1721 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12788. HGC6.1.1 (Accession NM\_014354) is another VGAM1721 host target gene. HGC6.1.1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HGC6.1.1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HGC6.1.1 BINDING SITE, designated SEQ ID:15684, to the nucleotide sequence of VGAM1721 RNA, herein designated VGAM RNA, also designated SEQ ID:4432.

[58044] Another function of VGAM1721 is therefore inhibition of HGC6.1.1 (Accession NM\_014354). Accordingly, utilities of VGAM1721 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HGC6.1.1. LOC254423 (Accession XM\_173286) is another VGAM1721 host target gene. LOC254423 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254423, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC254423 BINDING SITE, designated SEQ ID:46529, to the nucleotide sequence of VGAM1721 RNA, herein designated VGAM RNA, also designated SEQ ID:4432.

[58045] Another function of VGAM1721 is therefore inhibition of LOC254423 (Accession XM\_173286). Accordingly, utilities of VGAM1721 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254423. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1722 (VGAM1722) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[58046] VGAM1722 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1722 was detected is described hereinabove with reference to Figs. 1–8.

[58047] VGAM1722 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Myxoma Virus. VGAM1722 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[58048] VGAM1722 gene encodes a VGAM1722 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1722 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1722 precursor RNA is designated SEQ ID:1708, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1708 is located at position 4765 relative to the genome of Myxoma Virus.

[58049] VGAM1722 precursor RNA folds onto itself, forming VGAM1722 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[58050] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1722 folded precursor RNA into VGAM1722 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1722 RNA is designated SEQ ID:4433, and is provided hereinbelow with reference to the sequence listing part.

[58051] VGAM1722 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1722 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1722 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[58052] VGAM1722 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1722 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1722 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1722 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1722 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[58053] The complementary binding of VGAM1722 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1722 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1722 host target RNA into VGAM1722 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[58054] It is appreciated that VGAM1722 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1722 host target genes. The mRNA of each one of this plurality of VGAM1722 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1722 RNA, herein designated VGAM RNA, and which when bound by VGAM1722 RNA causes inhibition of translation of respective one or more VGAM1722 host target proteins.

[58055] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1722 gene, herein designated VGAM GENE, on one or more VGAM1722 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[58056] It is yet further appreciated that a function of VGAM1722 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1722 include diagnosis, prevention and treatment of viral infection by Myxoma Virus. Specific functions, and accordingly utilities, of VGAM1722 correlate with, and may be deduced from, the identity of the host target genes which VGAM1722 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[58057] Nucleotide sequences of the VGAM1722 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1722 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1722 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1722 are further described hereinbelow with reference to Table 1.

[58058] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM1722 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1722 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[58059] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1722 gene, herein designated VGAM is inhibition of expression of VGAM1722 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1722 correlate with, and may be deduced from, the identity of the target genes which VGAM1722 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[58060] Coronin, Actin Binding Protein, 2B (CORO2B, Accession XM\_035403) is a VGAM1722 host target gene. CORO2B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CORO2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CORO2B BINDING SITE, designated SEQ ID:32253, to the nucleotide sequence of VGAM1722 RNA, herein designated VGAM RNA, also designated SEQ

ID:4433.

[58061] A function of VGAM1722 is therefore inhibition of Coro-  
nin, Actin Binding Protein, 2B (CORO2B, Accession  
XM\_035403), a gene which may play a role in the reorga-  
nization of neuronal actin structure. Accordingly, utilities  
of VGAM1722 include diagnosis, prevention and treat-  
ment of diseases and clinical conditions associated with  
CORO2B. The function of CORO2B and its association with  
various diseases and clinical conditions, has been estab-  
lished by previous studies, as described hereinabove with  
reference to VGAM923. Forkhead Box E3 (FOX E3, Acces-  
sion NM\_012186) is another VGAM1722 host target gene.  
FOX E3 BINDING SITE1 and FOX E3 BINDING SITE2 are HOST  
TARGET binding sites found in untranslated regions of  
mRNA encoded by FOX E3, corresponding to HOST TARGET  
binding sites such as BINDING SITE I, BINDING SITE II or  
BINDING SITE III. Table 2 illustrates the complementarity  
of the nucleotide sequences of FOX E3 BINDING SITE1 and  
FOX E3 BINDING SITE2, designated SEQ ID:14471 and SEQ  
ID:14468 respectively, to the nucleotide sequence of  
VGAM1722 RNA, herein designated VGAM RNA, also des-  
ignated SEQ ID:4433.

[58062] Another function of VGAM1722 is therefore inhibition of

Forkhead Box E3 (FOXE3, Accession NM\_012186), a gene which regulates embryonic development. Accordingly, utilities of VGAM1722 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FOXE3. The function of FOXE3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM632.FLJ22002 (Accession NM\_024838) is another VGAM1722 host target gene. FLJ22002 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22002, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22002 BINDING SITE, designated SEQ ID:24247, to the nucleotide sequence of VGAM1722 RNA, herein designated VGAM RNA, also designated SEQ ID:4433.

[58063] Another function of VGAM1722 is therefore inhibition of FLJ22002 (Accession NM\_024838). Accordingly, utilities of VGAM1722 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22002. Fucosyltransferase 10 (alpha (1,3) Fucosyl-

transferase) (FUT10, Accession NM\_032664) is another VGAM1722 host target gene. FUT10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FUT10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FUT10 BINDING SITE, designated SEQ ID:26392, to the nucleotide sequence of VGAM1722 RNA, herein designated VGAM RNA, also designated SEQ ID:4433.

[58064] Another function of VGAM1722 is therefore inhibition of Fucosyltransferase 10 (alpha (1,3) Fucosyltransferase) (FUT10, Accession NM\_032664). Accordingly, utilities of VGAM1722 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FUT10. KIAA0014 (Accession NM\_014665) is another VGAM1722 host target gene. KIAA0014 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0014 BINDING SITE, designated SEQ ID:16120, to the nucleotide sequence of

VGAM1722 RNA, herein designated VGAM RNA, also designated SEQ ID:4433.

[58065] Another function of VGAM1722 is therefore inhibition of KIAA0014 (Accession NM\_014665). Accordingly, utilities of VGAM1722 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0014. KIAA0794 (Accession XM\_087353) is another VGAM1722 host target gene. KIAA0794 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0794, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0794 BINDING SITE, designated SEQ ID:39178, to the nucleotide sequence of VGAM1722 RNA, herein designated VGAM RNA, also designated SEQ ID:4433.

[58066] Another function of VGAM1722 is therefore inhibition of KIAA0794 (Accession XM\_087353). Accordingly, utilities of VGAM1722 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0794. MIL1 (Accession NM\_015367) is another VGAM1722 host target gene. MIL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region

of mRNA encoded by MIL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MIL1 BINDING SITE, designated SEQ ID:17667, to the nucleotide sequence of VGAM1722 RNA, herein designated VGAM RNA, also designated SEQ ID:4433.

[58067] Another function of VGAM1722 is therefore inhibition of MIL1 (Accession NM\_015367). Accordingly, utilities of VGAM1722 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MIL1. Prefoldin 1 (PFDN1, Accession NM\_002622) is another VGAM1722 host target gene. PFDN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PFDN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PFDN1 BINDING SITE, designated SEQ ID:8482, to the nucleotide sequence of VGAM1722 RNA, herein designated VGAM RNA, also designated SEQ ID:4433.

[58068] Another function of VGAM1722 is therefore inhibition of Prefoldin 1 (PFDN1, Accession NM\_002622). Accordingly,

utilities of VGAM1722 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PFDN1. LOC145195 (Accession XM\_096731) is another VGAM1722 host target gene. LOC145195 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145195, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145195 BINDING SITE, designated SEQ ID:40516, to the nucleotide sequence of VGAM1722 RNA, herein designated VGAM RNA, also designated SEQ ID:4433.

[58069] Another function of VGAM1722 is therefore inhibition of LOC145195 (Accession XM\_096731). Accordingly, utilities of VGAM1722 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145195. LOC157697 (Accession XM\_088365) is another VGAM1722 host target gene. LOC157697 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157697, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC157697 BINDING SITE, designated SEQ ID:39646, to the nucleotide sequence of VGAM1722 RNA, herein designated VGAM RNA, also designated SEQ ID:4433.

[58070] Another function of VGAM1722 is therefore inhibition of LOC157697 (Accession XM\_088365). Accordingly, utilities of VGAM1722 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157697. LOC222160 (Accession XM\_168431) is another VGAM1722 host target gene. LOC222160 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222160, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222160 BINDING SITE, designated SEQ ID:45165, to the nucleotide sequence of VGAM1722 RNA, herein designated VGAM RNA, also designated SEQ ID:4433.

[58071] Another function of VGAM1722 is therefore inhibition of LOC222160 (Accession XM\_168431). Accordingly, utilities of VGAM1722 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222160. LOC257449 (Accession XM\_031562) is another VGAM1722 host target gene. LOC257449 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257449, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257449 BINDING SITE, designated SEQ ID:31426, to the nucleotide sequence of VGAM1722 RNA, herein designated VGAM RNA, also designated SEQ ID:4433.

[58072] Another function of VGAM1722 is therefore inhibition of LOC257449 (Accession XM\_031562). Accordingly, utilities of VGAM1722 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257449. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1723 (VGAM1723) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[58073] VGAM1723 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1723 was detected is described hereinabove with reference to Figs. 1-8.

[58074] VGAM1723 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Myxoma Virus.

VGAM1723 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[58075] VGAM1723 gene encodes a VGAM1723 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1723 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1723 precursor RNA is designated SEQ ID:1709, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1709 is located at position 4097 relative to the genome of Myxoma Virus.

[58076] VGAM1723 precursor RNA folds onto itself, forming VGAM1723 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[58077] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1723 folded precursor RNA into VGAM1723 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1723 RNA is designated SEQ ID:4434, and is provided hereinbelow with reference to the sequence listing part.

[58078] VGAM1723 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1723 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1723 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[58079] VGAM1723 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1723 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1723 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1723 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1723 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[58080] The complementary binding of VGAM1723 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1723 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1723 host target RNA into VGAM1723 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[58081] It is appreciated that VGAM1723 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1723 host target genes. The mRNA of each one of this plurality of VGAM1723 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1723 RNA, herein designated VGAM RNA, and which when bound by VGAM1723 RNA causes inhibition of translation of respective one or more VGAM1723 host target proteins.

[58082] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1723 gene, herein designated VGAM GENE, on one or more VGAM1723 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[58083] It is yet further appreciated that a function of VGAM1723 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1723 include diagnosis, prevention and treatment of viral infection by Myxoma Virus. Specific functions, and accordingly utilities, of VGAM1723 correlate with, and may be deduced from, the identity of the host target genes which VGAM1723 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[58084] Nucleotide sequences of the VGAM1723 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1723 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1723 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1723 are further described hereinbelow with reference to Table 1.

[58085] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1723 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1723 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[58086] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1723 gene, herein designated VGAM is inhibition of expression of VGAM1723 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1723 correlate with, and may be deduced from, the identity of the target genes which VGAM1723 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[58087] LOC122210 (Accession XM\_058609) is a VGAM1723 host target gene. LOC122210 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC122210, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of LOC122210 BINDING SITE, designated SEQ ID:36681, to the nucleotide sequence of VGAM1723 RNA, herein designated VGAM RNA, also designated SEQ ID:4434.

[58088] A function of VGAM1723 is therefore inhibition of LOC122210 (Accession XM\_058609). Accordingly, utilities of VGAM1723 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC122210. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1724 (VGAM1724) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[58089] VGAM1724 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1724 was detected is described hereinabove with reference to Figs. 1–8.

[58090] VGAM1724 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabies Virus. VGAM1724 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[58091] VGAM1724 gene encodes a VGAM1724 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1724 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1724 precursor RNA is designated SEQ ID:1710, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1710 is located at position 3898 relative to the genome of Rabies Virus.

[58092] VGAM1724 precursor RNA folds onto itself, forming VGAM1724 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[58093] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1724 folded precursor RNA into VGAM1724 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1724 RNA is designated SEQ ID:4435, and is provided hereinbelow with reference to the sequence listing part.

[58094] VGAM1724 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1724 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1724 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[58095] VGAM1724 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1724 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1724 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1724 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1724 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[58096] The complementary binding of VGAM1724 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1724 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1724 host target RNA into VGAM1724 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[58097] It is appreciated that VGAM1724 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1724 host target genes. The mRNA of each one of this plurality of VGAM1724 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1724 RNA, herein designated VGAM RNA, and which when bound by VGAM1724 RNA causes inhibition of translation of respective one or more VGAM1724 host target proteins.

[58098] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1724 gene, herein designated VGAM GENE, on one or more VGAM1724 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,  
`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[58099] It is yet further appreciated that a function of VGAM1724 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1724 include diagnosis, prevention and treatment of viral infection by Rabies Virus. Specific functions, and accordingly utilities, of VGAM1724 correlate with, and may be deduced from, the identity of the host target genes which VGAM1724 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[58100] Nucleotide sequences of the VGAM1724 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1724 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1724 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1724 are further described hereinbelow with reference to Table 1.

[58101] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1724 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1724 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[58102] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1724 gene, herein designated VGAM is inhibition of expression of VGAM1724 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1724 correlate with, and may be deduced from, the identity of the target genes which VGAM1724 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[58103] Synaptogyrin 3 (SYNGR3, Accession NM\_004209) is a VGAM1724 host target gene. SYNGR3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SYNGR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYNGR3 BINDING SITE, designated SEQ ID:10406, to the nucleotide sequence of VGAM1724 RNA, herein designated VGAM RNA, also designated SEQ ID:4435.

[58104] A function of VGAM1724 is therefore inhibition of Synaptogyrin 3 (SYNGR3, Accession NM\_004209). Accordingly, utilities of VGAM1724 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with SYNGR3. HSPC195 (Accession XM\_087785) is another VGAM1724 host target gene. HSPC195 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSPC195, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPC195 BINDING SITE, designated SEQ ID:39420, to the nucleotide sequence of VGAM1724 RNA, herein designated VGAM RNA, also designated SEQ ID:4435.

[58105] Another function of VGAM1724 is therefore inhibition of HSPC195 (Accession XM\_087785). Accordingly, utilities of VGAM1724 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC195. KIAA1677 (Accession XM\_040383) is another VGAM1724 host target gene. KIAA1677 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1677, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1677 BINDING SITE, designated SEQ ID:33290, to the nucleotide sequence of VGAM1724 RNA, herein design-

nated VGAM RNA, also designated SEQ ID:4435.

[58106] Another function of VGAM1724 is therefore inhibition of KIAA1677 (Accession XM\_040383). Accordingly, utilities of VGAM1724 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1677. LOC221042 (Accession XM\_167669) is another VGAM1724 host target gene. LOC221042 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221042, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221042 BINDING SITE, designated SEQ ID:44759, to the nucleotide sequence of VGAM1724 RNA, herein designated VGAM RNA, also designated SEQ ID:4435.

[58107] Another function of VGAM1724 is therefore inhibition of LOC221042 (Accession XM\_167669). Accordingly, utilities of VGAM1724 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221042. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1725 (VGAM1725) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[58108] VGAM1725 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1725 was detected is described hereinabove with reference to Figs. 1–8.

[58109] VGAM1725 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabies Virus. VGAM1725 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[58110] VGAM1725 gene encodes a VGAM1725 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1725 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1725 precursor RNA is designated SEQ ID:1711, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1711 is located at position 8659 relative to the genome of Rabies Virus.

[58111] VGAM1725 precursor RNA folds onto itself, forming VGAM1725 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[58112] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1725 folded precursor RNA into VGAM1725 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1725 RNA is designated SEQ ID:4436, and is provided hereinbelow with reference to the sequence listing part.

[58113] VGAM1725 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1725 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1725 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[58114] VGAM1725 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1725 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1725 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1725 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1725 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[58115] The complementary binding of VGAM1725 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1725 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1725 host target RNA into VGAM1725 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[58116] It is appreciated that VGAM1725 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1725 host target genes. The mRNA of each one of this plurality of VGAM1725 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1725 RNA, herein designated VGAM RNA, and which when bound by VGAM1725 RNA causes inhibition of translation of respective one or more VGAM1725 host target proteins.

[58117] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1725 gene, herein designated VGAM GENE, on one or more VGAM1725 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[58118] It is yet further appreciated that a function of VGAM1725 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1725 include diagnosis, prevention and treatment of viral infection by Rabies Virus. Specific functions, and accordingly utilities, of VGAM1725 correlate with, and may be deduced from, the identity of the host target genes which VGAM1725 binds and inhibits, and the function of these host target genes, as elaborated herein—

below.

[58119] Nucleotide sequences of the VGAM1725 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1725 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1725 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1725 are further described hereinbelow with reference to Table 1.

[58120] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1725 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1725 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[58121] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1725 gene, herein designated VGAM is inhibition of expression of VGAM1725 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1725 correlate with, and may be deduced from, the identity of the target genes which VGAM1725 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[58122] ADP-ribosylation Factor 3 (ARF3, Accession NM\_001659) is a VGAM1725 host target gene. ARF3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARF3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARF3 BINDING SITE, designated SEQ ID:7378, to the nucleotide sequence of VGAM1725 RNA, herein designated VGAM RNA, also designated SEQ ID:4436.

[58123] A function of VGAM1725 is therefore inhibition of ADP-ribosylation Factor 3 (ARF3, Accession NM\_001659). Accordingly, utilities of VGAM1725 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARF3. Platelet-activating Factor Acetylhydrolase, Isoform Ib, Alpha Subunit 45kDa (PAFAH1B1, Accession NM\_000430) is another VGAM1725 host target gene. PAFAH1B1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PAFAH1B1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAFAH1B1 BINDING SITE, desig-

nated SEQ ID:6008, to the nucleotide sequence of VGAM1725 RNA, herein designated VGAM RNA, also designated SEQ ID:4436.

[58124] Another function of VGAM1725 is therefore inhibition of Platelet-activating Factor Acetylhydrolase, Isoform Ib, Alpha Subunit 45kDa (PAFAH1B1, Accession NM\_000430). Accordingly, utilities of VGAM1725 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAFAH1B1. FLJ10697 (Accession NM\_018181) is another VGAM1725 host target gene. FLJ10697 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10697, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10697 BINDING SITE, designated SEQ ID:20014, to the nucleotide sequence of VGAM1725 RNA, herein designated VGAM RNA, also designated SEQ ID:4436.

[58125] Another function of VGAM1725 is therefore inhibition of FLJ10697 (Accession NM\_018181). Accordingly, utilities of VGAM1725 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ10697. FLJ22679 (Accession NM\_032227) is another VGAM1725 host target gene. FLJ22679 BINDING SITE1 and FLJ22679 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ22679, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22679 BINDING SITE1 and FLJ22679 BINDING SITE2, designated SEQ ID:25953 and SEQ ID:19266 respectively, to the nucleotide sequence of VGAM1725 RNA, herein designated VGAM RNA, also designated SEQ ID:4436.

[58126] Another function of VGAM1725 is therefore inhibition of FLJ22679 (Accession NM\_032227). Accordingly, utilities of VGAM1725 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22679. Suppression of Tumorigenicity 7 Like (ST7L, Accession NM\_138727) is another VGAM1725 host target gene. ST7L BINDING SITE1 through ST7L BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ST7L, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the comple-

mentarity of the nucleotide sequences of ST7L BINDING SITE1 through ST7L BINDING SITE3, designated SEQ ID:28977, SEQ ID:19335 and SEQ ID:29207 respectively, to the nucleotide sequence of VGAM1725 RNA, herein designated VGAM RNA, also designated SEQ ID:4436.

[58127] Another function of VGAM1725 is therefore inhibition of Suppression of Tumorigenicity 7 Like (ST7L, Accession NM\_138727). Accordingly, utilities of VGAM1725 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ST7L. LOC116028 (Accession XM\_057225) is another VGAM1725 host target gene. LOC116028 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC116028, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC116028 BINDING SITE, designated SEQ ID:36492, to the nucleotide sequence of VGAM1725 RNA, herein designated VGAM RNA, also designated SEQ ID:4436.

[58128] Another function of VGAM1725 is therefore inhibition of LOC116028 (Accession XM\_057225). Accordingly, utilities of VGAM1725 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC116028. LOC150236 (Accession XM\_086824) is another VGAM1725 host target gene. LOC150236 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150236, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150236 BINDING SITE, designated SEQ ID:38906, to the nucleotide sequence of VGAM1725 RNA, herein designated VGAM RNA, also designated SEQ ID:4436.

[58129] Another function of VGAM1725 is therefore inhibition of LOC150236 (Accession XM\_086824). Accordingly, utilities of VGAM1725 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150236. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1726 (VGAM1726) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[58130] VGAM1726 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1726 was detected is described hereinabove with reference to Figs. 1–8.

[58131] VGAM1726 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabies Virus. VGAM1726 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[58132] VGAM1726 gene encodes a VGAM1726 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1726 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1726 precursor RNA is designated SEQ ID:1712, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1712 is located at position 9658 relative to the genome of Rabies Virus.

[58133] VGAM1726 precursor RNA folds onto itself, forming VGAM1726 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[58134] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1726 folded precursor RNA into VGAM1726 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1726 RNA is designated SEQ ID:4437, and is provided hereinbelow with reference to the sequence listing part.

[58135] VGAM1726 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1726 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1726 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[58136] VGAM1726 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1726 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1726 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1726 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1726 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[58137] The complementary binding of VGAM1726 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1726 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1726 host target RNA into VGAM1726 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[58138] It is appreciated that VGAM1726 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1726 host target genes. The mRNA of each one of this plurality of VGAM1726 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1726 RNA, herein designated VGAM RNA, and which when bound by VGAM1726 RNA causes inhibition of translation of respective one or more VGAM1726 host target proteins.

[58139] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1726 gene, herein designated VGAM GENE, on one or more VGAM1726 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[58140] It is yet further appreciated that a function of VGAM1726 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1726 include diagnosis, prevention and treatment of viral infection by Rabies Virus. Specific functions, and accordingly utilities, of VGAM1726 correlate with, and may be deduced from, the identity of the host target genes which VGAM1726 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[58141] Nucleotide sequences of the VGAM1726 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1726 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM1726 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1726 are further described hereinbelow with reference to Table 1.

[58142] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1726 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1726 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[58143] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1726 gene, herein designated VGAM is inhibition of expression of VGAM1726 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1726 correlate with, and may be deduced from, the identity of the target genes which VGAM1726 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[58144] G Protein-coupled Receptor, Family C, Group 5, Member B (GPRC5B, Accession NM\_016235) is a VGAM1726 host target gene. GPRC5B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by GPRC5B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPRC5B BINDING SITE, designated SEQ ID:18351, to the nucleotide sequence of VGAM1726 RNA, herein designated VGAM RNA, also designated SEQ ID:4437.

[58145] A function of VGAM1726 is therefore inhibition of G Protein-coupled Receptor, Family C, Group 5, Member B (GPRC5B, Accession NM\_016235), a gene which belongs to G protein-coupled receptor. Accordingly, utilities of VGAM1726 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPRC5B. The function of GPRC5B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM131.KIAA0893 (Accession NM\_014969) is another VGAM1726 host target gene. KIAA0893 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0893, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA0893 BINDING SITE, designated SEQ ID:17361, to the nucleotide sequence of VGAM1726 RNA, herein designated VGAM RNA, also designated SEQ ID:4437.

[58146] Another function of VGAM1726 is therefore inhibition of KIAA0893 (Accession NM\_014969). Accordingly, utilities of VGAM1726 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0893. KIAA1596 (Accession XM\_048128) is another VGAM1726 host target gene. KIAA1596 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1596, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1596 BINDING SITE, designated SEQ ID:35118, to the nucleotide sequence of VGAM1726 RNA, herein designated VGAM RNA, also designated SEQ ID:4437.

[58147] Another function of VGAM1726 is therefore inhibition of KIAA1596 (Accession XM\_048128). Accordingly, utilities of VGAM1726 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1596. MGC14836 (Accession NM\_033412) is another VGAM1726 host target gene. MGC14836 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC14836, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC14836 BINDING SITE, designated SEQ ID:27236, to the nucleotide sequence of VGAM1726 RNA, herein designated VGAM RNA, also designated SEQ ID:4437.

[58148] Another function of VGAM1726 is therefore inhibition of MGC14836 (Accession NM\_033412). Accordingly, utilities of VGAM1726 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC14836. PRSC (Accession NM\_006587) is another VGAM1726 host target gene. PRSC BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRSC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRSC BINDING SITE, designated SEQ ID:13348, to the nucleotide sequence of VGAM1726 RNA, herein designated VGAM RNA, also designated SEQ ID:4437.

[58149] Another function of VGAM1726 is therefore inhibition of

PRSC (Accession NM\_006587). Accordingly, utilities of VGAM1726 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRSC. LOC152627 (Accession XM\_087495) is another VGAM1726 host target gene. LOC152627 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152627, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152627 BINDING SITE, designated SEQ ID:39297, to the nucleotide sequence of VGAM1726 RNA, herein designated VGAM RNA, also designated SEQ ID:4437.

[58150] Another function of VGAM1726 is therefore inhibition of LOC152627 (Accession XM\_087495). Accordingly, utilities of VGAM1726 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152627. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1727 (VGAM1727) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[58151] VGAM1727 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1727 was detected is described hereinabove with reference to Figs. 1–8.

[58152] VGAM1727 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabies Virus. VGAM1727 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[58153] VGAM1727 gene encodes a VGAM1727 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1727 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1727 precursor RNA is designated SEQ ID:1713, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1713 is located at position 8962 relative to the genome of Rabies Virus.

[58154] VGAM1727 precursor RNA folds onto itself, forming VGAM1727 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[58155] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1727 folded precursor RNA into VGAM1727 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1727 RNA is designated SEQ ID:4438, and is provided hereinbelow with reference to the sequence listing part.

[58156] VGAM1727 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1727 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1727 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[58157] VGAM1727 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1727 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1727 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1727 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1727 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[58158] The complementary binding of VGAM1727 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1727 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1727 host target RNA into VGAM1727 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[58159] It is appreciated that VGAM1727 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1727 host target genes. The mRNA of each one of this plurality of VGAM1727 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1727 RNA, herein designated VGAM RNA, and which when bound by VGAM1727 RNA causes inhibition of translation of respective one or more VGAM1727 host target proteins.

[58160] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1727 gene, herein designated VGAM GENE, on one or more VGAM1727 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[58161] It is yet further appreciated that a function of VGAM1727 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1727 include diagnosis, prevention and treatment of viral infection by Rabies Virus. Specific functions, and accordingly utilities, of VGAM1727 correlate with, and may be deduced from, the identity of the host target genes which VGAM1727 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[58162] Nucleotide sequences of the VGAM1727 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the  
`diced` VGAM1727 RNA, herein designated VGAM RNA,  
and a schematic representation of the secondary folding  
of VGAM1727 folded precursor RNA, herein designated  
VGAM FOLDED PRECURSOR RNA, of VGAM1727 are further  
described hereinbelow with reference to Table 1.

[58163] Nucleotide sequences of host target binding sites, such as  
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of  
Fig. 1, found on VGAM1727 host target RNA, and  
schematic representation of the complementarity of each  
of these host target binding sites to VGAM1727 RNA,  
herein designated VGAM RNA, are described hereinbelow  
with reference to Table 2.

[58164] As mentioned hereinabove with reference to Fig. 1, a  
function of VGAM1727 gene, herein designated VGAM is  
inhibition of expression of VGAM1727 target genes. It is  
appreciated that specific functions, and accordingly utili-  
ties, of VGAM1727 correlate with, and may be deduced  
from, the identity of the target genes which VGAM1727  
binds and inhibits, and the function of these target genes,  
as elaborated hereinbelow.

[58165] Ankyrin-like with Transmembrane Domains 1 (ANKTM1,  
Accession NM\_007332) is a VGAM1727 host target gene.

ANKTM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ANKTM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ANKTM1 BINDING SITE, designated SEQ ID:14256, to the nucleotide sequence of VGAM1727 RNA, herein designated VGAM RNA, also designated SEQ ID:4438.

[58166] A function of VGAM1727 is therefore inhibition of Ankyrin-like with Transmembrane Domains 1 (ANKTM1, Accession NM\_007332), a gene which attaches integral membrane proteins to cytoskeletal elements. Accordingly, utilities of VGAM1727 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANKTM1. The function of ANKTM1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM644. Chitinase 3-like 1 (cartilage glycoprotein-39) (CHI3L1, Accession NM\_001276) is another VGAM1727 host target gene. CHI3L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHI3L1, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHI3L1 BINDING SITE, designated SEQ ID:6941, to the nucleotide sequence of VGAM1727 RNA, herein designated VGAM RNA, also designated SEQ ID:4438.

[58167] Another function of VGAM1727 is therefore inhibition of Chitinase 3-like 1 (cartilage glycoprotein-39) (CHI3L1, Accession NM\_001276), a gene which participates in the capacity of cells to respond to and cope with changes. Accordingly, utilities of VGAM1727 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHI3L1. The function of CHI3L1 has been established by previous studies. The major function of articular chondrocytes in growing and maturing cartilage is the deposition and remodeling of the cartilage matrix. In adult cartilage, the matrix must be maintained rather than formed. Chondrocytes secrete a variety of proteins. One of the major secreted proteins of human articular chondrocytes in monolayer or explant culture is referred to as human cartilage glycoprotein-39 (HC gp-39). HC gp-39 is also known as YKL-40. The name 'YKL' refers to the sequence of the amino terminus of the protein. (See also

YKL-39, 601526.) Hakala et al. (1993) purified HC gp-39 and determined the sequence of the cDNA. The protein is predicted to contain 383 amino acids, and has regions of similarity to several bacterial and fungal chitinases. HC gp-39 protein did not, however, possess any detectable chitinolytic activity. Hakala et al. (1993) found that expression of the GP39 gene by Northern blotting and RT-PCR was not restricted to chondrocytes. GP39 mRNA was detected in liver and human articular chondrocytes. Neither GP39 protein nor GP39 mRNA was detectable in normal newborn or adult human articular cartilage, but the mRNA was detected in cartilage obtained from patients with rheumatoid arthritis or at autopsy. By genomic sequence analysis, Rehli et al. (1997) determined that the CHI3L1 gene contains 10 exons and spans 8 kb. Primer extension and S1 nuclease protection analyses of the proximal promoter region identified transcriptional initiation sites 82 and 126 nucleotides upstream of the start codon.

[58168] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[58169] Hakala, B. E.; White, C.; Recklies, A. D. : Human cartilage

gp-39, a major secretory product of articular chondrocytes and synovial cells, is a mammalian member of a chitinase protein family. J. Biol. Chem. 268: 25803-25810, 1993. ; and

[58170] Rehli, M.; Krause, S. W.; Andreesen, R. : Molecular characterization of the gene for human cartilage gp-39 (CHI3L1), a member of the chitinase protein family and marker for late stages.

[58171] Further studies establishing the function and utilities of CHI3L1 are found in John Hopkins OMIM database record ID 601525, and in cited publications numbered 6533-6534 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Nuclear Receptor Subfamily 2, Group E, Member 1 (NR2E1, Accession NM\_003269) is another VGAM1727 host target gene. NR2E1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NR2E1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NR2E1 BINDING SITE, designated SEQ ID:9278, to the nucleotide sequence of VGAM1727 RNA, herein designated VGAM RNA, also designated SEQ ID:4438.

[58172] Another function of VGAM1727 is therefore inhibition of Nuclear Receptor Subfamily 2, Group E, Member 1 (NR2E1, Accession NM\_003269), a gene which may be required for brain development and be involved in the regulation of retinal development . Accordingly, utilities of VGAM1727 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NR2E1. The function of NR2E1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM689.FLJ10392 (Accession NM\_018084) is another VGAM1727 host target gene. FLJ10392 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ10392, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10392 BINDING SITE, designated SEQ ID:19847, to the nucleotide sequence of VGAM1727 RNA, herein designated VGAM RNA, also designated SEQ ID:4438.

[58173] Another function of VGAM1727 is therefore inhibition of FLJ10392 (Accession NM\_018084). Accordingly, utilities of VGAM1727 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ10392. FLJ23511 (Accession NM\_032239) is another VGAM1727 host target gene. FLJ23511 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23511, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23511 BINDING SITE, designated SEQ ID:25963, to the nucleotide sequence of VGAM1727 RNA, herein designated VGAM RNA, also designated SEQ ID:4438.

[58174] Another function of VGAM1727 is therefore inhibition of FLJ23511 (Accession NM\_032239). Accordingly, utilities of VGAM1727 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23511. KIAA0527 (Accession XM\_171054) is another VGAM1727 host target gene. KIAA0527 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0527, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0527 BINDING SITE, designated SEQ ID:45847, to the

nucleotide sequence of VGAM1727 RNA, herein designated VGAM RNA, also designated SEQ ID:4438.

[58175] Another function of VGAM1727 is therefore inhibition of KIAA0527 (Accession XM\_171054). Accordingly, utilities of VGAM1727 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0527. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1728 (VGAM1728) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[58176] VGAM1728 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1728 was detected is described hereinabove with reference to Figs. 1–8.

[58177] VGAM1728 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabies Virus. VGAM1728 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[58178] VGAM1728 gene encodes a VGAM1728 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM1728 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1728 precursor RNA is designated SEQ ID:1714, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1714 is located at position 4718 relative to the genome of Rabies Virus.

- [58179] VGAM1728 precursor RNA folds onto itself, forming VGAM1728 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [58180] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1728 folded precursor RNA into VGAM1728 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1728 RNA is designated SEQ ID:4439, and is provided hereinbelow with reference to the sequence listing part.

[58181] VGAM1728 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1728 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1728 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[58182] VGAM1728 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1728 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1728 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1728 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1728 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[58183] The complementary binding of VGAM1728 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1728 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1728 host target RNA into VGAM1728 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[58184] It is appreciated that VGAM1728 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1728 host target genes. The mRNA of

each one of this plurality of VGAM1728 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1728 RNA, herein designated VGAM RNA, and which when bound by VGAM1728 RNA causes inhibition of translation of respective one or more VGAM1728 host target proteins.
